3. A thermometer was placed in the receiver of an air pump, and the air being hastily exhausted, it sunk two or three degrees; but after fome minutes regained its former flation. The experiment was repeated with a thermometer open at the top, fo that the bulb could not be affected by any diminution of the external preffure; but the refult was the fame. Both during exhauthon and re-admittion of the air into the receiver, a fiream was regularly observed to be condensed on the fides of the glass; which, in both cases, was its a few minutes reabforbed, and which appeared to be precipitated by being deprived of its heat by the expunded air.

4. A hole, about the fize of a crow quill, was bored in a large air veffel placed at the commencement of the principal pipe of the water works of Derby. There are four pumps worked by a water wheel, the water of which is first thrown into the lower part of this air veffel, and rifes from thence to a refervoir about 35 or 40 feet above the level; so that the water in this

vessel is constantly in a state of compression. Two thermometers were previously suspended on the leaden air vellel, that they might affume the temperature of it, and as foon as the hole above mentioned was opened, had their bulbs applied to the stream of air which issued out; the confequence of which was, that the mercury funk four degrees in each. This finking of the mercury could not be ascribed to any evaporation of moisture from their furfaces, as it was feen both in exhaufling and admitting the air into the exhaufted receiver mentioned in the last experiment, that the vapour which it previously contained was deposited during its expansion.

5. There is a curious phenomenon observed in the fountain of Hiero, constructed on a very large scale, in the Chemologofian mines in Hungary. In this machine the are in a large velfel, is compressed by a column of water see feet high ra floo-cock is then opened; and as the air issues with great vehemence, and in confequence of its previous confeniation becomes immediately intohier panded, the moditure it contains is not contains in the exhausted receiver above mensional life life life in the life hijower of show, with wisher althorage to the note of the rock. iphere.

Iphere, as I found it in general in my country house at Southal-Green, ten miles from London, from June to September, lay between 103 and 109. I was furprifed when, upon my return to town to my former lodgings to Pall-Mall Court, I found the common air purer in general in October than I used to find it in the middle of fummer in the country; for on the 22d of October, at nine o'clock in the morning, the weather being fair and frofty, I found that one measure of common air, and one of nitrous air, occupied 100 fubdivisions in the glass tube, or exactly one measure. That very day, at two o'clock in the afternoon (it being then rainy weather), the air was somewhat altered for the worfe. It gave 102. October the 23d, it being rainy weather, the zir gave 102. October the 24th, the weather being ferene, the air at nine o'clock in the morning gave 100. October the 25th, the sky being cloudy at 11 o'clock in the morning, the air gave 102. At 11 o'clock at night, from five different trials, it gave 105. October the 26th, the weather being very dark and rainy, the air gave 105, as before."

The air at Oftend was found by the Doctor to be generally very good, giving between 94 and 98. At Bruges, the air taken at feven o'clock at night gave 103. November the 8th, the air at Ghent at three in

the afternoon gave 103.

November the 12th, the air of Bruffels at feven o'clock P. M. gave 1051. The next day the zir of the lower part of the same city gave 106; that of the highest appeared to be purer, as it gave Toq: which agrees with the common popular observation. Novemi ber the 14th, both the air of the highest and that of the lowest part of the city appeared to be of the limit goodness, giving 103. The weather was frolly:

November the 22d, the air of Antwerp in the ing gave 109; the weather being rainy, delay, and cold. November the 23d, the air of Breda gare The next day about II o'clock the air gave 1000 weather being fair, cold, and inclining to trots feven o'clock it gave 103. Next day being the at the air gave 104; the weather being cold and in The 26th, it gave 103; the weather being very thing cold, and flormy. November the 27th, the air st the Moordyke close to the water gave 1014; the weather being fair and cold, but not frofty. This fpot is reckoned very healthy. November the 38th, the air of Rotterdam gave 103; the weather being rainy and cold. November the 29th, the air of Delft gave rog; the weather being floring and raing.

November the 30th, the air of the Hague gave 104; the weather being cold, and the wind northerly. The ist of December the weather underwent a sudden change; the wind becoming foutherly and formy, and the atmosphere becoming very hot. The day after lahrenheit's thermometer flood at 54°; and the common air being repeatedly and accurately tried gave 116; and that preferved in a glass phial from the preceding day gave 117; and that gathered close to the

fea gave 115.

December the 4th, the air of Amsterdam gave 103; the weather being rainy, windy, and cold. The day

after, the weather continuing nearly the same, the air gave 102. December the 10th, the air of Rotterdam gave 101; the weather being ramy. December the 12th, being in the middle of the water between Dort and the Moordyke, the air gave 109; the weather being remarkably dark, rainy, and windy. December the 13th. the air of Breda in the morning gave 109; the weather continuing as the day before. And in the afternoon, the air gave 106; the weather having cleared up. December the 16th, the air of the lower part of the city of Antwerp gave 105, that of the higher part 104; the weather being rainy and temperate. December the 17th, the air of Antwerp gave 107: the weather continuing nearly as in the preceding day. Decomber the 19th the air of Bruffels gave 109; the weather being rainy, windy, and rather warm. Dccember the wift, the wir of Booffels gave 106; the weather being dry and rold. The next day the air and weather continued the fame. December the 23d, the wir of Mone gave ton the weather being ramy and cold. Decompts the same the air near Boucham, gave 1047 the weather being should and sold. December the said, the sir of Persons ways 2001; the secution being from. December the said, the sir of Cuvili gave 101; the same from, December the 27th, the sir of Living Same Said Could be said to the said to December the said was a weather from the said was

Ingentiones subservations His Apparatus ingendouse a more was her Mer, with which his experi-tion of the state of the stat no made his last one made.

The Address of the State of the very accurate experiment with the student, etternion opinion in the fellowing made in the store not the state he fraction in the students, that the experiments and its afficulty of the students and students are store on plants uncertaintent countries and students of the different from one another."

When all the errors are correduct, it will be found that the difference between the air of one country and that of another, at different times, is much less than what is commonly believed; and that the great differences found by various observers are owing to the fallacious effects of uncertain methods. This I advance from experience; for I was in the fame error. I found

VELLA

(A) It is plain that Dr Ingenhousz's method is not implied in this remark; fince the Doctor's experiments swere made long after, and the method used by him was properly that of Mr Fontana.

Sphere

Atooi.

Atmo-

very great differences between the refults of the experiments of this nature, which ought to have been fimilar; which diversities I attributed to myself, rather than to the method I then used. At Paris I examined the air of different places at the fame time, and especially of those situations where it was most probable to meet with infected air, because those places abounded with putrid substances and impure exhalations; but the differences I observed were very small, and much less than what could have been suspected, for they hardly arrived to one-fiftieth of the air in the tube. Having taken the air of the hill called Mount Volerian, at the height of about 500 feet above the level of Paris, and compared it with the air of Paris taken at the fame time, and treated alike, I found the former to be beedly one thirtieth better than the latter.

"In Loudon I have observed should the same. The air of Islington and that of London Inflered as agreed

and very little from cache adject. the Movember laft, I found the sir for the first time much better, fas.it gave ki, I, 1,80, and II, II, 2,20; but the nath of February 1779, the sir gave II, I, 1,69 and II, II, 2,21; from whence it appears, that the air of this 14th of February was better than that been fix months before. There can be no agnot of the accuracy of the experiments, because I compared the air taken at different times with that which I had first used in the month of September, and

which I had preserved in dry glass bottles accurately flopped."

This difference in the purity of the air at different times, Mr Fontana farther remarks, is much greater than the difference between the air of the different places observed by him: notwithstanding this great change, as he observed, and as he was informed by various persons, no particular change of health in the generality of people, or facility of breathing, was perceived.

Mr Fostana laftly concludes with observing, that 14 Nature is not fo partial as we commonly believe. She has not only given us an air almost equally good everywhere at every time, but has allowed us a certain latitude, or a power of living and being in health in qualities of air which differ to a certain degree. By this I do not mean to deny the existence of certain kinds of noxious air in some particular places; but only lay, that in general the air is good everywhere, and that the small differences are not to be feared fo much as fome people mould make us believe. Nor do I mean to facility lone vapours and other bodies which the hat do not change its nature and intrinfical the test of sitrous air; and those vapours are to be confidered in the same manner as we should consider so particles of arlevie swimming in the atmosphere. the midd kill the animals who ventured to breathe

ATOCK, the capital of a province of the same panie in the dominions of the Great Mogul. It is feated of a point of land where two large rivers meet, and the best fortresses the Mogul has; but forthe Mogul himself. E. Long. 72. 10. at to admit of no division. Atoms are the miadure, and are conceived as the first principles or ment parts of all physical magnitude.

TURICAL PHILOSOPHY, or the doctrine of atome, a fystem which, from the hypothesis that atome are endued with gravity and motion, accounted for the critica and formation of things. This philosophy was firs beginched by Molchus, some time before the Troian with the was much cultivated and improved by Epiconia statement it is denominated the Epicorean

ATONY, in making whereas of tone or tention, as a langur or debling of the folids of the body.

Long. 200. 20. N. Lat. 21. 57. Towards the merth-east and north-west, the face of the country is rugged and broken that to the fouthward it is more even. The bills rife from the sea-side with a gentle acclivity, and at a little diffance back are covered with wood. Its produce is the same with that of the other islands of this cluster; but its inhabitants greatly excel the people of all the neighbouring islands in the management of their plantations. In the low grounds, contiguous to the bay wherein our navigators anchored, these plantations were regularly divided by deep ditches; the fences were formed with a neatness approaching to elegance, and the roads through them were finished in such a manner as would have reflected credit even on a European engineer.

The island is about 300 miles in circumference. The road, or anchoring place, which our veilels occupied, is on the fouth-well fide of the island, about two leagues from the west end, before a village named Wymoa. As far as was founded, the bank was free from rocks: except to the eastward of the village, where there projects a floal on which are fome rocks and breakers. This road is fomewhat exposed to the trade-wind; notwithflanding which defect, it is far from being a bad station, and greatly superior to those which necessity continually obliges ships to use, in countries where the winds are not only more variable but more boifterous; as at Madeira, Teneriffe, the Azores, &c. The landit g too is not fo difficult as at most of those places; and, unless in very bad weather, is always practicable. The water in the neighbourhood is excellent, and may be conveyed with eafe to the boats. But no wood can be cut at any convenient distance, unless the islanders could be prevailed upon to part with the few etoon trees (cordia febellina) that grow about their will lages, or a species called door door, which grows there up the country. The ground, from the wooded part's to the fea, is covered with an excellent kind of grafs, about two feet in height, which foractimes grows in tufts, and appeared capable of being converted abundant crops of fine hay. But on this are the converted to not even a flirub grows naturally.

Atra-dies, the use of the infuf. Sena limonies. warmed with the Atractylis. ting. columb. he had checked the vomitings occasioned by this matter.

ATRA DIES, in antiquity, denotes a fatal day whereon the Romans received fome memorable defeat. The word literary imports a llack day; a denomination taken from the colour; which is the emblem of death and mourning. Whence the Thracians had a custom of marking all their happy days with white stones or calculi, and their unhappy days with black ones; which they cast, at the close of each day, into an urn, At the person's death the stones were taken out; and from a comparison of the numbers of each complexion. a judgment was made of the felicity or inferior of his course of life. merly used as a warm diaphoretic and asexipharmic: but it never came much into use in Britain, and the present practice has entirely rejected it. The root is about an inch thick, externally of a pale rufty brown colour, corroded as it were in the furface; and perforated with numerous small holes, so as to appear wormeaten when cut. It has a firong smell; and a subacid, bitterifh, and weakly aromatic tafte. Frederick Hoffman the Elder relates, that he has observed a decoction of it is broth to occasion vomiting.

ATRÆTI, in medicine, infants having no perforation in the anus, or persons imperforated in the vagina or urethra.

ATRAGENE, in botany : A genus of the polyandria order, belonging to the polygamia class of plants. The calys has four leaves; the petals are 12; and the feeds are candated. There are three species, all natives of the East.

ATRAPHAXIS: A genus of the digynia order, belonging to the nexandria class of plants; and in the the 12th order, Holorathe calva bas two leaves; the petals are two, stated; and there is but one feed. There are pener, beth natives of warm countries, but merit-

ATRI, a town of Italy, in the farther Abruzzo in the kingdom of Naples, with the title of a duchy; it is the see of a bishop, and is seated on a craggy mountain, four miles from the Adriatic fea. E. Long. 13. 8. N. Lat. 42. 45

ATRIENSES, in antiquity, a kind of fervants or officers in the great families at Rome, who had the care and inspection of the atria and the things lodged therein.

These are otherwise called atriarii, though some make a distinction between atrienses and atriarii; fuggefling that the latter were an inferior order of fervants, perhaps affiliants of the atrienfes, and employed in the more fervile offices of the atrium, as to attend at the door, fweep the area, &c.

The atrienfes are represented as servants of authority and command over the reft: they acted as procurators, or agents, of their mafter, in felling his goods, &c. To their care were committed the flatues and images of the mafter's ancestors, &cs which were placed round the atrium; and which they carried in proceflion at fineerals, &c.

In the villas, or country houses, the atrienses had the care of the other furniture and utenfils, particularly those of metal, which they were to keep bright from ruft. Other things they were to hang from tune to time in the fan, to keep them dry, &c. They were clothed in a short white linen habit, to distinguish them, and prevent their loitering from home.

ATRIP, in nautical language, is applied either to the auchor or fails. The anchor is atrip, when it is drawn out of the ground in a perpendicular direction, either by the cable or buoy rope. The top fulls are atup, when they are hoifted up to the mast head, or to then atmost extent.

ATRIPLEX, orach, or arach: A genus of the monorcia order, belonging to the polygamia claric of plants; and, in the natural method, ranking under the 12th order, Holoracea. The calyx of the hermaphradite flower has five leaves; there is no corolla; the flomma are five, and the flylus is bifid; the feed in one, and depressed.

Spicies. 1. The hortenfis, or garden orach, was formerly cultivated in gardens and used as a substitute for spinage, to which it is still preferred by some, the in general it is disliked by the English; however, is full maintains its credit in France, as also in the northern parts of England. There are three or four varieties of this plant, whose only difference is their colour; one is a deep green, another a dark purple, and a third with green leaves and purple borders. 2. The halimus, or broad leaved orach, was formerly cultivated in gare. dens as a fhrub, by some formed into hedges, and confantly flicared to keep them thick : but this is a parpufe to which it is by no means adapted, as the fhoots give fo vigorous, that it is impossible to keep the hedge in any tolerable order; and, what is worfe, in fevere winters the plants are often destroyed. 3. The petulacoides, or fhrubby fea orach, grows wild by the fea fide in many places of Britain. It is a low under floub, feldom rifing above two feet and a half, or at most three feet high; but becomes very bushy. This may have a place in gardens among other low shrubs,

where it will make a pretty diversity. Befides these, Atrium, nine other species are chamerated by botanical writers, Atropabut the above-mentioned are the most remarkable.

Culture, &c. The first fort is annual, fo must be propagated by feeds. These are to be fown at M.chaelmas, doon after the feeds are ripe. The plants require no other culture than to be kept free from weeds, to hoe them when they are about an inch high, and to cut them down when they are too thick, fo as to leave them about four inches afunder. When thefe plants are fown in a rich foil, and allowed a good distance from each other, the leaves will grow very large, and in this their goodness confists. This must be eaten whilst it is young; for when old, the leaves become tough, and are good for nothing. This species is an article of the materia medica ; a decoction of the leaves is recommended in coffiveness, where the patient is of a hot bilions disposition. The second fort may be propagated by cattings. These are to be planted in any of the fummer months, in a shady border; where they will look take root, and be fit against the followmany war too the foot and be integrated the following. Michaelmen to treatplant into those places where they are to remain the third fortrequent very little calcure. A TROPA, manuar wronness. A genus
the managrala order, belonging to the pentagdria of plants; and in the natural method ranking as
the right order. Larids. The corolle is campa lated; the flamma are diffact; the berry is globular, and consists of two cells. The species are five; of which the three following are the most remarkable. 1. The belladonn's grows wild in many parts of Britain. It hath a perennial root, which fends out ftrong herbaceous fisiks of a purplish colour, which rife to the beight of four or five feet, garnished with entire oblong leaves, which towards autumn change to a purplish colour. The flowers are large, and come out fingly between the leaves, upon long footftalks; bellshaped, and of a dusky colour on the outside, but purplish within. After the flower is past, the germen turns to a large round berry a little flatted at the top. It is first green; but when ripe turns to a shining purple juice of a nauseous sweet taste, and full of small kidney-thaped feeds. 2. The frutescens is a native of

Spain, and rifes with a shrubby stem to the height of

fix or eight feet; dividing into many branches garnish-

ed with round leaves, in shape like those of the storax

tree: their are placed alternately on the branches. The flowers come out between the leaves on fhort foot-

stalks, shaped like those of the former, but much less;

Atropa. black, fits close upon the empalement, and contains a

of a dirty yellowith colour, with a few brown stripes: but these are never succeeded by berries in Britain. 3. The herbacea, with an herbaceous stalk, is a native of Campeachy. This hath a perennial root, which puts forth feveral channelled herbaceous stalks ring about two feet; and towards the top they divide into two or three small branches marrified with oval leaves four inches long and three broads sering feveral prominent transverse ribe on their modernide. The flowers come out from between the lessys on foot footfalks; they are white, and the pod tike those of the common first, but latalier. It slowers in Jest and Argest, but folden ripers its first in Berland. In It williams or mendenter schick just have submitted into the mate and female. The stall smarting later were larged large and thickness in the support at Country of head, and beautiful stall. the body and thighe of a arife a number of sery long middle narrow towards the t at the only the five inches or chicago and dufky, and dispersion of tid lead! The female iner in sta in with feveral and the street and at leftwith a real continues, and the street and are who are lettifully dispute the street all, he was correctly a draught of vinegar. Anchomas also gives an account of the destruction of the anny of Sweno the Dane, when he invaded Scotland, by mixing a quantity of the belladonna berries with the drink which the Scots were, recording to a treaty of truce, to supply them with. This fo intoxicated the Danes, that the Scots fell upon them in their sleep, and killed the greatest part of them, so that there were scarcely men enough left to

carry off their king. There have also been many in- Atrops stances in Britain of children being killed by eating berries of a fine black colour, and about the fize of a fmall cherry, which are no other than those of belladonna. When an accident of this kind is discovered in time, a glass of warm vinegar will prevent the bad

The third species has been recommended in cases of barrenness, but without foundation. Its fresh root is a violent purge, the dofe being from ten grains to twenty in substance, and from half a drachm to a drachm in infusion. It has been found to do service in hytheric complaints; but must be used with great caution, otherwise it will bring on convultions, and many other mischievous symptoms. It has also a narcotic quality. At prefent only the fresh leaves are sometimes used in anodyne and emollient cataplaims and fomentations. It nied to be an ingredient in one of the old officinal unguents; but both that and the plant itself are now rejected from our pharmacopæius. It still however tetains a place in the foreign ones, and may perhaps be confidered as deferring farther attention.

Naturalists tell strange stories of this plant ; but letting afide its loporiferous virtue, the modern botawills will feares warrant any of them, nor even that hismen figure ordinarily afcribed to its roots, especially frace the discovery of the artifice of charletans in fa-

given in Plate XCI. however, was taken from the state of There words of which the grade of which the first of which the brought home to his mother. TROPOS, in fabulous history, the name of the whird of the Paroze, or Exten, whose business it was to seat the thread of life.

ATTACHMENT, in the law of England, implies the taking or apprehending a person by virtue of a writ or precept. It is distinguished from an arrefl, by proceeding out of a higher court by precept or writ; whereas the latter proceeds out of an inferior court by precept only. An arrest lies only on the body

mert.

Attachment Attainder.

of a man; whereas an attachment lies often on the goods only, and fometimes on the body and goods. An attachment by writ differs from diffress, in not extending to lands, as the latter does; nor does a diffress touch the body, as an attachment does.

ATTACHMENT out of the Chancery, is obtained upon an affidavit made, that the defendant was ferved with a fubpoma, and made no appearance; or it issues upon not performing some order or decree. Upon the return of this attachment by the sheriff, quod non est inventus in balleva sua, another attachment, with a proclamation, issues; and if he still refuses to appear, a commission of rebellion.

ATTACHMENT of the Forest, is one of the three courts held in the forest. The lowest court is called the court of attachment, or avood-mote court; the mean, fwan-mote; and the highest, the justice in eyer's feat. The court of attachments has its name from the verdurers of the forest having no other authority in it, but to receive the attachments of offenders against vert and venision taken by the foresters, and to enroll them, that they may be presented or punished at the next justice in eyer's feat. This attachment is by three means a by goods and shattels; by body, pledges, or main, prize; or by the body only. This court is held every: 40 days throughout the year; and is thence called form, by days court.

Foreign ATTACHMENT is an eachment of money or goods found within a liberty or city, to fatisfy foreign creditor within fuch liberty or city. By the culture of London, and feveral other places, a man con straigh money or goods in the hands of a ftranger, to this himself.

ATTACK, a violent attempt upon and portion of thing, an affault, or the act of beginning a combine dispute.

ATTACK, in the military art, is an effort resistant force a poil, break a body of troops, &c.

ATTACK of a Siege, is a furious affault mich. befiegers with trenches, covers, mines, &c. in bright to make themselves masters of a fortrels, by floration one of its sides. If there are two or three attacks made at the same time, there should be a combining tion betwirt them. See War.

ATTACOTTI, an ancient people of Britain, meationed by Ammianus Marcelliaus and St. Jerome, it, well as in the Notitia Imperii. They are represented as allies and confederates of the Scots and Title and therefore probably their neighbours: the precise fituation has not been determined by authorsries.

ATTAINDER, in law. When sentence of destriction most terrible and highest judgment in our laws, in pronounced, the immediate inseparable consequence of the common law is attainder. For when it is now close beyond all dispute, that the criminal is no longer sto live upon the earth, but is to be exterminated as a monster and a bane to human society, the law sets a monte of infamy upon him, puts him out of its protection, and takes no farther care of him than barely to see him executed. He is then called attains, attinuous, stained, or thackned. He is no longer of any credit or reputation; he cannot be a witness in any court; neither is the capable of performing the functions of an-

other man: for, by an anticipation of his punishment, Attainder he is already dead in law. This is after judgment: for Attaint. there is great difference between a man convicted, and attainted; though they are frequently through ina: curacy confounded together. After conviction only, a man is liable to none of these disabilities; for there is still in contemplation of law a possibility of his innocence. Something may be offered in arrest of judgement: the indictment may be erroncous, which will render his guilt uncertain, and thereupon the prefent conviction may be quashed: he may obtain a pardon, or be allowed the benefit of clergy; both which suppose: fome latent sparks of merit, which plead in extenuation of his fault. But when judgment is once pronounced, both law and fact confpire to prove him completely. guilty; and there is not the remotell possibility left of any thing to be said in his favour. Upon judgment, therefore, of death, and not before, the attainder of a criminal commences or upon fuch circumflances as outland, on a provide rime, proposing of as judgment of outland, on freing tour judgment at the housing confesses the absence of outlands of the confesses of outlands of the confesses of the co are equivalent to judgment of deaths, as judgment of

ATTAINT, is a win that his after judgment as gainst a judy of twelve ment to the latter given salie verdict in any court of second, is an action real or perfonal, where the debt or damages amount to above 40s. Stat. 5 and 34 Ed. III. c. 7. It is called attaint, because the party that obtains it endeavours thereby to stain or taint the credit of the jury with perjury, by whose verdict he is grieved.

The jury who are to try this falle verdict muß be twenty-four, and are called the grand jury t for the law

Attalica.

Attaint wills not that the nath of one jury of twelve men should be attainted or fet aside by an equal number, nor by less indeed than double the former. And he that brings the attaint can give no other evidence to the grand jury, than what was originally given to the petit. For as their verdict is now trying, and the question is whether or no they did right upon the evidence that appeared to them, the law adjudged it the highest absurdity to produce any subsequent proof upon such trial, and to condemn the prior jurisdiction for not believing evidence which they never knew. But those against whom it is brought are allowed, in the affirmance of the first verdict, to produce new matters because the petit jury may have formed their verdict upon evidence of their own knowledge, which noter appeared in court; and because very terrible was the judgment which the common law inflicted upon their, if the grand judy found their world a latte out. The judgment was, That they frould into their fliances force, and become for ever seramine. A. Distriction defined soficiently their ground and children on Alany shell had a comment (flought be, functional the fliance had a line of the fliance of th

ATTELABUS, in zoology, a genus of infects belonging to the order of coleoptera or beetle kind. It has four wings, of which the superior are crustaccous, and ferve as a sheath or cover to the inferior, which are membraneous. The head tapers behind, and is inclined; the feelers turn thicker towards the apex. The species are 13: viz. 1. The coryli is black with red elytra or crustaceous wings. 2. The avellana is black, with the breaft, feet, and elytra red. 3. The curculionoides is black, with red elytra and hreaft. The above three species frequent the leaves of the hazel and filbert nut trees. 4. The furinamentis has a double indentation (or two teeth) in the top of the elytra. It is a native of Surinam. 5. The penntilvanious is black, with red elytra, a black belt round the middle, and another towards the apex of the elytra. It is a marive of Pennsylvania. 6. The melanurus is black, with testaceous clytra, black at the apex. It is a na-Sweden. 7. The betula has faltatory or fpringy. and the whole body is of a dark red colour. It the leaves of the birch tree. 8. The formihelt towards the base. It is a native of Europeania speed, with a hairy breast, and a cellow belt upon the elytra. 10. The apiarius ithired elytra, and three black belts. It is a native of base it is a native belt. It is a native belt in the ceramboides is of a blackish red the elytra are surrowed. It frequents the frecise of mushroom. 13. The bull and red colour, with a globular breast, it is a native of Europe.

On; a due application of the car, or thing said or done, in order to accorded thereof. The word is compounded and sendo, "I struck." helt towards the bate. It is a native of Europe.

and sendo, "I firetch."

sind is not properly an act of the unbut rather of the will, by which it cansal and any from the confideration of other obcolor and direct it at the thing in hand. wing to the degree of attention, objects make a frenger or weaker impression (A). Attention is re-といいいいはい quifite

all the fenfes are bound and fulpended, mulic is far fareter than when one is fully waking."

⁽a) Bacon, in his natural history, makes the following observations: " Sounds are meliorated by the init tention of the lenfe, where the common lenfe is collected most to the particular fenfe of bearing, and the fight suspended. Therefore sounds are sweeter, as well as greater, in the night than in the day; and I supse pose they are sweeter to blind men than to others; and it is manifest, that between sleeping and waking, when ...

Attention, quifite even to the simple act of seeing : the eye can Attenuants take in a confiderable field at one look; but no object in the field is feen diffinctly but that fingly which fixes the attention: in a profound reverie that totally occupies the attention, we scarce fee what is directly before us. In a train of perceptions, no particular object makes fuch a figure as it would do fingly and apart; for when the attention is divided among many objects no particular object is entitled to a large share. Hence the fullness of night contributes to terror, there being nothing to divert the attention:

Horror ubique animos, simul ipsa silentia terrent. Æn. ii.

Zara. Silence and folitude are everywhere! Through all the gloomy ways and iron doors That hither lead, nor human face nor voice Is hen or heard. A dreadful din was wont To grate the fenfe, when enter'd here; from groans And howls of flaves condemn'd, from clink of chains, And crash of rusty bars and creaking hinges; And ever and anon the fight was dash'd With frightful faces, and the meagre looks Of grim and ghaftly executioners. Yet more this ftillness terrifies my fout . Than did that feene of complicated horrors. Mourning Bride, Act V. Ic. 1.

In matters of flight importance, attention is mostly directed by will; and for that reason, it is our own fault if trifling objects make any deep impression, Ha we power equally to withhold our attention from mit ters of importance, we might be proof against any deep impression. But our power fails us here : an interest ing object feizes and fixes the attention beyond possibility of controul; and while our attention is thus forcibly attached to one object, others may folicat in

admittance; but in vain, for they will not be the

ATTENUANTS, or ATTENUATING are fuch as fubtilize and break the humous me the parts; and thus dispose them for motion, circulation, excretion, &c.

Attenuating and inciding medicines are of very tentive use in physic, and come under different desta minations, according to the different effects they print duce. Thus, when tenacious and viscid juices not caly stagnate in the cavities of the vessels, but obstruct the minute ducts of the viloera and emunctories, thele medicines, by their inciding and attenuating quality, discharge the humours, and remove the obstructions; for which reason they are not improperly called ape-

Attendants produce so great a variety of effects, that it in proper we should be well acquainted with their the kinds, as appropriated to the several dis-

orders, and know which will prove most serviceable in Attenuants each. According to Hoffman, the diffolving and attenuating of viscid crudities in the stomach and prime Atterbury. via, is well answered by the roots of arum, acorus, pepper, ginger, and the like; as also by sal ammoniac, vitriolated tartar, the fixed alkaline falts, and the fimple or dulcified spirit of falt. When crude and unconcocted humours are to be evacuated by stool, this intention is very well answered by the neutral salts, as the falts of the purging waters, and the fal polycrestum, with a sufficient quantity of a watery vehicle.

When viscid humours, occasioning disorders of the breait, are to be attenuated and expectorated, the intention is enost effectually answered by elecumpane and orns roots; and by gum ammoniacum, myrrh, or benjamin, and balfam of Peru; or by regenerated tartar, oxymel of liquilis, a folution of crahs eyes in diffilled wineger, and the fyrings of tobacco, and the

ATTERBURY (Dr Francis), ion of Dr Lewis Atterbury, was born at Milton in Bucking hamshire; 1662; educated at Westminster; and from thence elected to Christ-Church in Oxford, where he soon distinguished himself by his fine genius and turn for polite literature. The year he was made M. A. 1687, he exerted himself in the controversy with the Papists, vindicated Luther in the strongest manner, and showed an uncommon fund of learning, enlivened with great vivacity. In 1690 he married Miss Osborn, a distant

great beauty, but with little or no fortune, who lived at or in the neighbourhood of Oxford.

In Feb. 1690-1, we find him refolved " to bestir himself in his office in the house;" that of cenfor probably, an officer (peculiar to Christ-church) who presides over the classical exercises; he then also held the catechetical lecture founded by Dr Busby.

About this period it must have been that he took orders, and entered into another scene, and another fort of converfation; for in 1691 he was elected lecturer of St Bride's church in London, and preacher at Bridewell chapel. An academic life, indeed, must have been irksome and insipid to a person of his active and aspiring temper. It was hardly possible that a clergyman of his fine genius, improved by Rudy, with a fpirit to exert his talents, thould remain long unnoticed; and we find that he was foon appointed chaplain to King William and Queen Many

The frare he took in the controverty against Bentley (about the genuinesclass Philippie's Linkley) is now very clearly aftertistical in one of the letters to his noble pions, determined in the letters to his noble pions, determined in the letter to his noble pions, determined in the letter to his noble pions, determined in the delign of the letter to his noble pions.

chaptains is actions and a few parties are the present of the pres August 30. 1706, at the funeral of Mr Thomas Bennet a bookfeller. In 1707, Sir Jonathan Trelawny, then bishop of Exeter, appointed him one of the camone residentiaries of that church. In 1709, he was engaged in a fresh dispute with Mr Hoadly, concerning " Passive Obedience;" occasioned by his Latin Sermon, entitled " Concio ad Clerum Londinensem, habita in Ecclesia S. Elphegi." In 1710, came on the famous trial of Dr Sacheverell, whose remarkable

speech on that occasion was generally supposed to have Atterbury. been drawn up by our author, in conjunction with Dr Smalridge and Dr Freind. The fame year Dr Atterbury was unanimously chosen prolocutor of the Lower House of Convocation, and had the chief management of affairs in that house. May 11. 1711, he was appointed by the convocation one of the committee for comparing Mr Whiston's doctrines with those of the church of England; and in June following, he had the chief hand in drawing up " A Representation of the Present State of Religion." In 1712, Dr Atterbury was made dean of Christ Church, notwithstanding the strong interest and warm applications of several great men in behalf of his competitor Dr Smalridge. The next year faw him at the top of his preferment, as well as of his reputation: for, in the beginning of June 1713, the queen, at the recommendation of Lord Chancellor Harcourt, advanced him to the bishopric of Rochester, with the dennery of Westminster in commendam; he was confirmed July 4. and confecrated at Lambeth next day.

At the beginning of the fucceeding reign, his tide of presperity began to turn; and he received a fentible mortification prefently after the coronation of Ling George I. when, upon his offering to prefent his majefty (with a view, no doubt, of flanding better in his favour) with the chair of state or royal canopy, his own perquifites as dean of Westminster, the offer with rejected, not without some evident marks of distribution person.

Darries the rebellion in Scotland, when the pre-

tender declaration was dispersed, the archbishop of Canferbary, and the bishops in and near London, had mabished a Declaration of their Abhorrence of the fre-Rebellion, and an Exhortation to their Clergy and Country to be usualous in the discharge of their duties to his March the biftop of Rochester rebe several the high-church party. He appeared generamong the protesters against the measures of the states with his own hand, we find him adviting Dean Swift in the

resignment of a refractory chapter. April 26. 1722,

this memorable year, or a fulpicion of his being mere and a more in seven of the pretended, he was prehended August 24, and committed prifoner to the Tower.

in the officers, the under feeretary, and a mellenger, were about two o'clock in the afternoon to the bishop's house at Wostminster, where he then was, with orders to bring him and his papers before the council. He happened to be in his night gown when they came in; and being made acquainted with their buliness, he desired time to dress himself. In the mean time his fecretary came in; and the officers went to fearch for his papers; in the fealing of which the meffenger brought a paper, which he pretended to have

Auerbury, found in his close flool, and defired it mightibe lealed up with the rest. His Lordship observing it and believing it to be a forged one of his own, defired the officers not to do it, and to bear witness that the paper was not found with him. Nevertheless they did it; and though they behaved themselves with some respect to him, they suffered the messengers to treat him in a very rough manner, threatening him, if he did not make hafte to dress himself, they would carry lum away undreft as he was. Upon which he ordered his secretary to see his papers all sealed up, and went himself directly to the Cock-pit, where the council waited for him. The behaviour of the mellengers, upon this occasion, seems to have been very unwarrantable, if what the author of A. Letter to the Clergy of the Church of England, the kc. tells us be true, that the persons, directed by order of the king and council, to feize his Lordship and his papers, received a strict command to treat him, with great respect and reverence. However this was, when he came before the council, he behaved with a great deal of calmness, and they with much civility towards him. He had liberty to speak for himself as much he pleased, and they listened to his desence with morest deal of attention; and, what is more unafual, attention was withdrawn, he had twice liberty to recently the council chamber, to make for himfelf fuch representations and requests as he thought, proper. It is feld. that, while he was under examination, he made our Saviour's answer to the Jewish council, while stood before them; "If I tell you, ye will not an lieve me; and if I also ask you, we will not an lieve nor let me go." After three quarters of the three three control to itay at the Cock-pit, he was fent to the vately, in his own coach, without any manner and or observation.

or observation.

This commitment of a bishop upon a high treason, as it was a thing rarely property of the coordinated various. the Reformation, fo it occasioned various Those who were the among the people. friends, and pretended to the greater him, laid the whole odium of the matter history. They knew the bishop is that fuccession, his professed above and settled contempt of the pretends. prudence, and circumspection, to be luch never allow him to engage is an attempt of the government, fo hazardous in itself nant to his principles; and therefor all to the malice and management of of flate or two, who were refulved to remove account of fome perfonal prejudices, as well as constant molestation he gave them in parliament. the particular influence and activity he had hown the late election. The friends to the ministry, on the other hand were firongly of opinion, that the billion was fecretly a favourer of the pretender's chile, and had formerly been tampering with things of that nature, even in the queen's time, and while his party was excluded from power; but upon their re-admiffion, had relinquished that pursuit, and his confederates therein, and become a good subject again. They urged, that the influence which the late duke of Ormond had over him, ailisted by his own private ambi-

tren and revenge, might prompt him to many things Atterbury. contrary to his declared fentiments, and inconfiftent with that cunning and caution which in other cafes he was mafter of. And to obviate the difficulty, arifing from the bishop's aversion to Popery, and the pretender's bigotry to that religion, they talked of a new invented scheme, of his, not to receive the pretender, whose principles were not to be changed, but his fon only, who was to be educated a Protestant in the church of England, and the bishop to be his guardian, and lord protector of the kingdom, during his minority. These, and many more speculations, amused the nation at that time; and men, as usual, judged of things by the measure of their own affections and

March 29-17224 abill was brought into the house of comments for " inflifting dertain pains and penalties on Erancia lord history of Rochester;" a copy of which was first to him, with sprice that he had liwhich was reny so, came were source task in the horse of gointiel and foliations for making his defence. Useder the billion applied, by petition, de the distribution and for their direction and advice in the source of the control house of the control house of the control house of together no in provided, not a the or combined to to a higher fation in the church ! There is not a man in my office farther removed from this than I am. Was money my aim? I always despised it too much, considering what occasion I am now like to have for it; for our of a poor bishopric of 500l. per annum, I have laid out. no less than 1000l. towards the repairs of the church and episcopal palace; nor did I take one shilling for dilapidations. The reft of my little income has been

Atterbury spent, as is necessary, as I am a bishop. Was I influenced by any diflike of the established religion, and fecretly inclined towards a church of greater pomp and power? I have, my lords, ever fince I knew what Popery was, opposed it; and the better I knew it, the more I opposed it. I began my study in divinity, when the Popish controversy grew hot, with that immortal book of Tillotfon's, when he undertook the Protestant cause in general; and as such, I esteemed him above all. You will pardon me, my lords, if I mention one thing: Thirty years ago, I writ in defence of Martin Luther; and have preached, expressed, and wrote to that purpose from my infancy; and whatever happens to me, I will fuffer any thing, and, by God's grace, burn at the flake, rather than depart from any material point of the Protestant religion as professed in the church of England. Once more: Can I be supposed to favour arbitrary power? The whole tenor of my life has been otherwife : I was almays a friend to the liberty of the fabject; and, to the belt of my power, confiantly maintained it. I may have been thought militaken in the measures I took to Compact. Figural is indicate and his what party I was collect to the Collection of t confidential to accompanies of the formation of the forma

feeming frength in the proofs against me; if, by your Atterburg. lordships judgments, springing from unknown motives, I shall be thought to be guilty; if, for any reasons or necessity of state, of the wisdom and justice of which I am no competent judge, your lordships shall proceed to pass this bill against me; I shall dispose myself quietly and tacitly to fubmit to what you do; God's will be done: Naked came I out of my mother's womb, and naked shall I return; and, whether he gives or takes away, bleffed be the name of the Lord i"

On Monday the 13th he was carried for the last time from the Tower to hear the reply of the king'r counsel to his desence. These were both men of great knowledge and fagacity in law, but of different talents in point of eloquence. Their speeches on this occafion were made public; and they feem to have formed their " Replies," defignedly, in a different way. The former flicks close to the matter in evidence, and enforces the charge against the bishop with great strength and perspicuity to The latter answers all his objections and refutes the arguments brought in his defence, in an easy fost manner, and with great simplicity of 102foring. Mr Reeve is wholly employed in facts, in comparing and uniting together circumstances, in order to corroborate the proofs of the bithop's guilt : Mr Wearg is chiefly taken up in filencing the complaints of the bishop and his counsel, and replying to every thing they advance, in order to invalidate the allegathe one, in fhort, possesses the minds of the lords with strong convictions against the hillion : The other dispossesses them of any favaluable impression that might possibly be made upon them by the artifice of his defence. And accordingly Receve is firong, nervous, and enforcing; but Mr Wearg, fmooth, eafy, and infinuating, both in the the of his expression and the turn of his perior is the highest compliments to the highest compliments to the highest compliments to the highest compose but, at the same time, represents it the property of the management of the period to impose upon the reason, and mit under the period to impose upon the reason, and mit under the period to impose upon the reason, and mit under the period to impose upon the reason, and mit under the period to impose upon the reason, and mit under the period to the peri the judgment of his hearers in proportion as it affects d the gallions; and he endeavours to flrip the bishop's On the exth the bill was read the third time; and. after a long and warm debate, passed on the 16th, by

a majority of \$3 %0 44. On the 27th, the king came to the house, and confirmed it by his royal affent. this emisent prelate, having the day this leave of his friends, who, from the time that the ball against him to the day of his desed on board the Aleborough man of war, and 4 L landed

(a) The following associate was first communicated to the public by the late Dr Maty, on the credit of Lord Chesterfield : I went (faid Lord Chesterfield) to Mr Pope, one morning, at Twickenham, and found a large folio Bible, with gilt claips, lying before him upon his table; and, as I knew his way of thinking upon that book, I asked him, jocosely, if he was going to write an answer to it? It is a present, said he, or rather a legacy, from my old friend the bishop of Rochester. I went to take my leave of him yesterday in the Tower, where I saw this Bible upon his table. After the first compliments, the bishop said to me : " My friend Pope, confidering your infirmities, and my age and exile, it is not likely that we should ever meet again; and therefore I give you this legacy to remember me by it. Take it home with you; and let me advise you to abide by it .- Does your Lordship abide by it yourself? - I do.' If you do, my Lord, it is but lately. May

Atterbury, landed the Friday following at Calais. When he went on shore, having been informed that Lord Bolingbroke. who had, after the rifing of the parliament, received the king's pardon, was arrived at the fame place on his return to England, he faid, with an air of pleafantry. "Then I am exchanged!" and, it was, in the opinion of Mr Pope on the fame occasion, " a fign of the nation's being curfedly afraid of being overrun with too much politeness, when it could not regain one great man but at the expence of another." But the severity of his treatment did not cease even with his banishment. The same vindictive spirit pursued him in foreign climes. No British subjects was even permitted to vifit him without the king's fign manual, which Mr Morice was always obliged to folicit, not only for himself, but for every one of his family whom he carried abroad with him, for which the fees of office were very high.

When Bishop Atterbury first entered upon his banishment, Brussels was the place destined for his refi-

dence; but, by the arts and infligations of the British Atterbury. ministers, he was compelled to leave that place, and retire to Paris. There being folicited by the friends of the pretender to enter into their negotiations, he changed his abode for Montpelier in 1728; and, after residing there about two years, returned to Paris, where he died Feb. 15. 1731-2. The affliction which he fultained by the death of his daughter in 1729, was thought to have haltened his own diffolution. The former event he hath himself related in a very affecting manner, in a letter to Mr Pope: "The earnest defire of meeting one I dearly loved, called me abruptly to Montpelier; where, after continuing two months under the cruel torture of a fad and fruitless expectation, I was forced at last to take a long journey to Toulousc; and even there I had miffed the perion I fought, had the not, with great spirit and courage, sentured all night up the Garonne to see me, which she above all things defined to do before the died. By that means the was brought where I was, between feven and eight 3 m . 1 . 1 . 1 . 1 . 1

A. Pope. Yours, A. Pope,

"The last letter of Mr Pope to the hishop, previous to his going into exile, was written very early in June 1723. It must have been about this time that Pope paid his farewell will to the bishop in the Tower. But whether such a conversation as that which hath been pretended actually took place, may be left to the determination of every man of common fenfe, after comparing Lord Chefterfield's anecdote with Mr Pope's letter.

"There must been a mistake, or a wilful misrepresentation somewhere. To determine its origin, or to mark minutely the trious degrees of its progress, till it issued forth into calumny and falsehood, is impossible. I have simply stated matters of fact as they are recorded; and leave it to your readers to settle other points not quite so obvious and indisputable, as they may think sit. My motives in this very plain relation rose from an honest wish to remove unmerited obloquy from the dead.

I should sincerely rejoice if the cloud which in other respects still shades the character of this ingenious prelate could be removed with equal facility and success. I sin, dear Sir, your faithful humble fervant, SAMUEL BADCOCK."

Amerbury, in the morning, and lived 20 hours afterwards; which time was not loft on either fide, but paffed in fuch a manner as gave great fatisfaction to both, and fuch as, on her part, every way became her circumstances and character: For the had her fenfes to the very laft gasp, and exerted them to give me, in those few hours, greater marks of duty and love than the had done in all her lifetime, though the had never been wanting in either. The last words she said to me were the kindest of all; a reslection on the goodness of God, which had allowed us in this manner to meet once more, before we parted for ever. Not many miputes after that, the laid herfelf on her pillow, in a Aceping posture,

Placidaque ibi demunt morte quievit. Judge your Sir, what I felt, and still feel; on this occafion, and spare me the trouble of describing it. At my age, under my influenties, among after thrangers, how shall I find out proper refine and supports t I can have none, but thisle with which realon and seligion have none, but third with which realized and selection furnish me: and those I lay hold on, and grasp as fast; as I can. determine one.

In his (posts, to also truste at fords, the blands, mentions his brand "engaged the correspondence with two lesisted man History Portes and Dr Wadi) on lettling the times of waiting the four golpels." Paist of this correspondence is still in being, and will soon be published. The same subject the bishop pursued during his exile, having confulted the learned of all nations, and had nearly brought the whole to a conclusion when he died. These laudable labours are an ample confutation of Bishop Newton's affertion, that Atterbury " wrote little whilst in exile but a few criticifms on French authors."

His body was brought over to England, and in-

terred on the 12th of May following in Westminster Attorbury abbey, in a vault which in the year 1722 had been prepared by his directions. There is no memorial over his grave: nor could there well be any, unters his friends would have confented (which it is most probable they refused to do) that the words implying him to have died bishop of Rochester should have been omitted on his tomb.

Some time before his death, he published a vindication of himself, Bishop Smalridge, and Dr Aldrich, from a charge brought against them by Mr Oldmixon, of having altered and interpolated the copy of Lord Clarendon's " History of the Rebellion." Atterbury's "Sermons" are extant in four volumes in octavo: those contained in the two first were published by himfelf, and dedicated to his great patron Sir Jonathan Trelawney bishop of Winchester; those in the two last were published after his death by Dr Thomas Moore his lordihip's chaplain. Four admirable "Vifitation Charges 11: accompany his " Epistolary Correspondence."

As to Bishop Atterbury's character, however the moral and political part of it may have been differentrepresented by the opposite parties, it is universally wigreed, that he was a man of great learning and uncommon abilities, a fine writer, and a most excellent preacher. His learned friend Smalridge, in the speech grande when he presented him to the Upper House

(who in their cups had offered violence to their cups packs), and divise the relt out of the country. Our two effociates these proceeded to Sparts, where Thefer fell in love with the famed Helena, at that time not above nine wears old, while he hanfelf was upwards of fifty. Her they carried off: and of the rape there are various accounts; but the following ont, which is given by Plutarch, is generally allowed to be the most authentic :-

According to that historian, they stoke this beauty, the greatest in the world at that time, out of the temple of Diana Ortin, where Helena happened to be duncing. They were pursued as far as Tegea, but made-

Anics. their escape out of Peloponnesus; and thinking themfelves now fecure of their prey, they agreed to cast lots for her, upon condition that he to whose lot she fell should assist the other in procuring some celebrated beauty. Fortune having declared for Thefens, he affifted his companion in the like attempt upon Proferpina daughter of Aidonius king of the Molosli in Epirus; who, being the next beauty to Helena, was guarded by the dog Cerberus, which had three heads, and was confequently a very formidable enemy. Her father, however, understanding that they defigned to steal away his daughter, threw Perithous to be torn to pieces by Cerberus, and put Thefeus in prifon, from by the king whence he was afterwards relieved at the intercession of of Epirus. Hercules.

of Athens.

After this misfortune, Thefeus at length returned to Athens, but found himfelf very coolly received by his fubjects. Mueltheus, the fon of Peteus, and greatgrandfon of Erectheus, had made use of the king sabsence to ingratiate himself with the people; and, upon the commencement of a war with Caftor and Pollux, the two brothers of Heleus, he perfuaded the people of Athens to open their gates to the two brothers. Up-Driven out on this, Thefeus was under the necessity of conveying away himself and family with all possible privacy. This he luckily accomplished; and defigned to have failed 10 Crete, to have obtained affistance from Deucalion fon of Minos, and now brother-in-law to Thefens himfelf, he having lately married Pleadra fifter to Devealions Unfortunately, however, our hero was shipwreches on the island of Seyros. Here he was at first kindly received by Lycomedes the king of that island; but was foon after killed by a fall from a high rock, oven which fome fay he was pushed by Lycomedes himself, who had been prevailed upon to destroy Theseus in that manner by Muchheus, that he might with the more fecurity enjoy the kingdom of Athens. ... A . . & . '15!

άι.

His death.

Mneffheus reigned 24 years, but lost his life at the Mueithous, fiege of Troy; and was succeeded by Demophon and Demophon, of the fons of Thefeus by Phadra, who was likewife at the fiege of Troy, but had the good fortune to gettern in fafety. In his reign was creeted the famous court of the Ephetic; confisting originally of 50 Athenians and as many Argives, for trying of wilful murden. By this court the king himfelf afterwards fubmitted to be tried for having accidentally killed one of his fabicate. He reigned 33 years, and was succeeded by his son and cording to fome, or according to others his brother, Oxyntes, who reigned 12 years. Oxyntes was increeded by his fon Aphydas, who was murdered by Thymates the baffard fon of Oxyntes.

24 Thymates depofed.

This king discovered many base qualities unworthy of his dignity; and at last was deposed by his subjects on the following occasion: Xanthus king of Bootia had a contest with the Athenians about one of their frontier towns. He offered to decide the matter by single combat with the king; but this was declined by Thymates. It happened, that at that time one Melanthus a Messenian, who had been driven out of his country by the Herachide, was come to Athens; who accepted the king of Bootia's challenge. At the first onfet, Melanthus asked his adversary, why he had, contrary to the articles, brought a fecond into the field with him? and as Xanthus immediately looked about to fee who was behind him, Melanthus run him thro' with

his lance. This victory, though it did little honour to Attles. him who gained it, was so agreeable to the Athenians, that they depoted their cowardly king Thymietes, after he had reigned 8 years; and appointed Melanthus Melanthus. in his flead, who after a reign of 37 years left the kingdom to his fon Codrus.

This prince reigned about 21 years; during which Codrus the time the Dores and Herachdæ had regained all Pelo-laft king ponnefus, and were upon the point of entering into facrifices Attica. Codrus, being informed that the oracle had himfelf for promifed them victory provided they did not kill the his country. king of the Athenians, came immediately to a refolution of dying for his country. Difguifing himfelf, therefore, like a pealant, he went into the enemy's camp, and, quarrelling with some of the soldiers, was killed by them. On the morrow, the Athenians knowing what was done, fent to demand the body of their king , at which the invaders were to terrified, that they decamped without firiking a blow.

... Upon the death of Codrus, a dispute which happened Republican among his fons concerning the faccession, furnished the govern-Athenians with a pretence for ridding themselves of ment intro-Attenions with a preferce for ridding themselves of ment in their kings altogether and changing the monarchical duced form of government in the second changing the monarchical duced form of government in the second changing a second change at Coloring and to mark the themselves a second they resolved themselves no may be in Junior 30 to they may have been a few for the second of Coloring themselves in the Medical distribution of the Medical distribution of the Medical distribution of the Medical distribution of the Medical distribution. family of Codrus. mentioned in history, yet no connected account on he found either of him or his inflitutions; only, in general his laws were exceedingly fevere, inflicting death for the smallest faults; which gave occasion to one Demades an orator to observe, that the laws of Draco were written with blood, and not with ink. For this extraordinary feverity he gave no other reason, than that small faults seemed to him to be worthy of death, and he could find no higher punishment for the greateft. He was far advanced in years when he gave laws to Athens; and to give his inflitutions the greater weight, he would not fuffer them to be called nomei, or laws, but thesmoi, or functions proceeding from more than human wildom. The extreme severity of these Expedied laws, however, foon made the Athenians weary both of the city. them and the author of them; upon which Draco was

Attica.

obliged to retire to Ægma. Here he was received with the highest honours. but the favour of the inhabitants of this place proved more fatal to him than the hitred of the Athemans; for coming one day into the theatre, the audience, to show then regard, threw, as the custom then was, their cloaks upon him; and the multitude of these being very great, they stifled the old man, who IL. death. was too weak to dilengage himfelf from their load.

After the expulsion of Draco, nothing remarkable happened at Athens till the year before Chult 606, Mitylenian when we find the republic engaged in a war with the Mitylenians about the city Siggum, fituated near the mouth of the river Scamander. The Atheman army was commanded by Phrynon, a perion equally remarkable for the comeliness of his person and the generosity of his mind. The Mityleniana were commanded by Pittacus, one of the celebrated fages of Greece. As thefe commanders looked upon the honour of their respective countries to be concerned, they exerted themselves to the utmost. At last they mer in angle combat : wherein Phrynon depended on his valour only: but Pittacus concealed behind his shield a net, wherewith he sud-

The characters with his brother, formal mann to make their allows best after many formal manns to make their allows best after the citizens of the citizens and the citizens of the citizens and the citizens of the citizen most proper time, he wandirected to make it distance them to the mercy; of which Meyacles confirming into a renunciation by the goddels, caused his men to fall upon them and despatch as many as they could find. Such as were without the temple were immediately massacred, and those who sted thither again were miridered in their fanduary. In thort, none escaped but such as bribed the wives of the officers of justice. This carnage, however, did not put an end to the fedition. The remains of Cylon's faction orested great diffurbances, by infiniating that the violation of Minerva's iancluary had drawn down the an-Who were ger of the god; and these discourses had such an effect, that Megacles and his officers were flyled execuable, and be people, held to be perfons under the displeasure or heaven.

Du ing the time of this cof to, no Megacolins Att's. attacked Nifea, which they took, as well as Suamis; and fo completely routed the Athenians in every attempt to recover the latter, that a law was at last pas fully with fed, by which it fliould be capital for any one to pro-Megara pose the recovery of Salamis. About the same time the city was disturbed by reports of frightful appearances, and filled with superstitious fears; the oracle at Delphi was therefore confulted, and an answer returned that the city behaved to be explated. Upon this, I pimenides the Phestian was sent for from Ciete, to perform the necessary ceremonies, he being reputed a holy man, and one that was deeply skilled in all the mysteries of religion. His exputtion consisted in tak-1 pinchiing some black, and some white sheep, turning them descripall loofe, and directing some persons to follow them to tion and those places where they couched, and there to facrifice prophecy them to the local deity. He caused also many temples and chapels to be erected, two of which have been partroularly noted, viz. the chapel of Contumely and that of Impudence. This man is faid to have looked witten fully on the port of Munychia for a long time, and then to have spoken as follows to those that were near him, 44 How blind is man to future things! for did the Athemans know what mischief will one day be derived to them from this place, they would cat it with their teeth." This prediction was thought to be ac ourphilhed 270 years after, when Antipates confirmed

the Athenians to admit a Maccdonian garrison into Athenian legislator began to show himself to his coun-wile he ftrymen. He is faid to have been lineally descended later from Codrus; but left by his father in circumftances mither recessitous, which obliged him to apply to merchradile: it is plain, however, both from his words and writings, that he was a difinterelled patriot. The thamain decree, that none under pain of death should ropede the recovery of Salamis, grieved him fo nuch, that having composed on elegy of 100 verses, such as le thought would be most proper to inflame the minds of the people; he ran into the market place as if he had been mid, with his night cap on his head, repeating de clegys A crowd being gathered round the pre-Salar isrtended madman, bis kiniman Pilitratus mingled among covered !. the reft, and observing the people moved with Solon's his merwind to also feconded him with all the cloquence he is and between them they prevailed to further was immediately being against the people of Megara. Who was populated in this expedition is not certain; but the was recovered, according to the most general

with Pilikratus to Colias, and finding there the women buly in celebrating, according to custom, the feath of Ceres, fent a confident of his to Salamis, who pretended to be no friend to the people of Atrica, telling the inhabitants of Salamie, that if they had a mind to feize the fairest of the Athenian ladies, they might now do it by pulling over to Colias. The Megarentians giving cafy credit to what the man faid, immediately fitted out a ship; which Solon perceiving from the opposite shore, dismissed the women, and having dressed a number of beardless youths in female habits, under

Anien which they concealed every one a dagger, he lent them to the fea-fide to dance and divert themselves as the women were wont to do. When those who came from Salamis faw these young persons skipping up and down, they strove who should be hist on shore; but were every one of them killed, and their vessel seized; aboutd which the Athenians embarking, failed immediately to balamis and took it.

Curha likeced by So-

On the return of Solon to Athens, he was greatly wife redu- honoured by the people, to whom another occasion of admiring his wildom was quickly afforded. The inhabitants of Curha, a town lituated in the boy of Corinth, after having by repeated incursions wasted the territory of Delphi, at last besieged the capital itself, with a view of making themselves matters of the treafures contained in the temple of Apollo. Advice of this intended facrilege being fent to the Amphicipons, who were the states-general of Greece, Solon advised that the matter should be universally referred, and that all the states should join in punishing the Circheans, and faving the Delphic oracle. This advice was complied with, and a general war against Cirrha declared. Clyfthenes, tyrant of Sicyon, commanded in thief, and Alemnon was general of the Athenian quota. Solon went as afhilant or counfellor to Clyfftienes, and by following his advice the war was conducted to a properous iffue. For when the Greek army had besieged Circle for forne time without any appearance of luccells, the oracle of Delphi was confulted, from whener the following answer was returned:

> "In vain you hope to take the place before " The ica's blue waves roll o'er the hallowed shore."

This answer struck the whole army with surprise, till Solon advised Clysthenes to confectate folemaly the whole territory of Circle to the Delphis Apollo ; is as that was a maritime country, the fea much thes walls the facied coast. According to Pausanus, the circular reduced by the following strategem, Market wented by Solon. He caused the river Philips, which run through Circha, to be turned into another inter hoping thereby to have diftreffed the intraction to want of water: but finding they had many walks in the city, and were not to be reduced by that me he caused a vast quantity of rents of hellebore to be thrown into the river, which was then duffered to see turn into its former bod. The subsbittents, at the fight of running water, came in trees to tizens being no longer able to defend the walls in town was easily taken.

Athens in rteat conulion.

On the return of Solou to Athens, be found the again in the utmaft confusion. The seminate of lon's faction gave out, that all forts of misfortunes he befallen the republic on account of the impiety of Mogacies and his followers t which clamour was heightened by the retaking of Splann's about this time by the Megarenfians. Solon interpoled, and perfunded these who were flyled exerable to abide a trial, and goo perfons were chosen to judge them. The event was, that 300 of Megacles's party who were alive were feat into perpetual banishment, and the bones of such as were dead were dug up and fent without the limits of their

2

Though this decision restored the public quiet for the Artica prefent, it was not long before the people were divided into three factions, contending about the proper form of government. Their were called the Diacen, Pediai, Three and Peruli; the first of these were the inhabitants of factions the helly country, who declared politively for demo-fait up. cracy; the second dwelling in the lower parts, and who were far more opulent than the former, declared for an oligarchy, as supposing the government would fall mostly into their hands; the third party who lived on the ica coalt, were people of moderate principles, and therefore were for a mixed government. Bendes the diffurbances raised on this account, others were occasioned by the rich oppressing the poor. According to Plutarch, the poor being indebted to the rich, either tilled their grounds and paid them the fiath part of the produce, or engaged their bodies for their debts, for that many wore made flaves at home, and many fold into other countries; say, some were obliged to fell their children to pay their debte, and others in despain quitted Attica altogether. The greatest part, however, were for throwing off the yoke, and began to Fresh shows for a backer speeply declaring that they in-tended to the state of the preventage, and stake a repeated to the state of the preventage, and stake all the critical state of the state of the state of the destinate for all these or the force signify a but he per-ceptage for the state of the state of the state of the state of the haved in luch a min dericational despets a trivit of patiential a special of the large in the particle of the large in the large

45 Infamous behaviour

friends,

Attica. he had removed fo many marks of mortgages (n) as were everywhere frequent; that he had freed from apprehension such as were driven to despair, &c.

But in the midft of all Solon's glory, an accident befel hem, which for a time, hurt his reputation, and of his three had almost entirely ruined his schemes. He had confolted Conon, Clinias, and Hipponicus, his three friends, on an oration prepared with a view to engage the people's confent to the discharge; and these three men, thus knowing there was to be a general discharge of debts, bafely took the opportunity of horrowing vaft fums before the law was promulgated," in confequence of which they were never obliged to return them.

This was thought at first to have been done with Solon's confent, and that he had shared in the money? but this afpertion was quickly wiped off when it apa peared that the lawgiver himself was a very confiderable lofer by his own law. His friends, however, could never recover their eredit; but were ever afterwards fligmatized with the opprobitous appellation of thireocopida, or debt-finkers. In the spice with the some was a

Atties. rendered his implacable enemies. A concourse of people being inflantly formed, Solon came among the rest, and, suspecting the deceit, openly taxed Pisislratus with his perfidious conduct; but to no purpole. A general affembly of the people was called, wherein it was moved by one Arithon, that Publicatus should have a guard. Solon was the only person present who had resolution enough to onnote this measure: the ticher Athenians. perceiving that the multitude implicitly followed Pifiltratus, and applauded every thing he faid, remaining filent through fear. Solon himself, when he saw he could prevail nothing, left the affembly, faying he was wifer than fome, and flouter than others. A guard of 400 men was now unanimously decreed to Pisistratus, as we are told by Solon himfelf. This inconfiderable body he made use of to collave the people, but in what matter he accomplished his purpose is not agreed. Certain it is, that with his guard he feized the citadel: but Polyænus hath given an account of a very fingular method which he took to put it out of the power of the Athenians to defend themselves even against such a fmall number. He fummoned an affembly to be held at the Angeium, and directed that the people should come thither armed. They accordingly came; and Publicatus harangued them, but in a voice fo low that they could not tell what he faid. The people complaining of this, Pililliatus told them that they were lundered from hearing him by the clangour of their arms; but if they would lay them down in the pertico, he would then be heard diffinctly. This they did; and while they liftened very attentively to a long and eloquent oration, Philitratus's guard conveyed away their arms, fo that they found themfelves depriv-Silon leavesed of all power of refillance. During the confusion which followed this event, another affembly was held, wherein Solon inveighed bitterly against the meannefs of his countrymen, inviting them to take up aims in defence of their liberty. When he faw that nothing would do, he laid down his own arms, faying; that he had done his utmost for his country and his laws. According to Plutarch, he refused to quit the city; but the most probable opinion is, it hat be immedrately retired from the dominions of Athens, and re-

fused to return, even at the solicitation of Pilistratus Piliftratus roverus with great moderation.

by Megache.

himfelf. . Pilistratus, having thus obtained the fovereignty, aid not overturn the laws of Solon, but uled hit with the greatest moderation. "It is not to be care." ed, however, that fo turbulent a people in the mans could be fatisfied by any method of government he could lay down. At the beginning of his adminiilration, Megacles and his family retired out of Athena; to fave their own lives, yet without despairing of being able feme time or other to return. With this view: Megacles and his affociates entered into a treaty with Lycurgus; and having brought him and his party into a scheme for deposing Pisistratus, they concerted mat-Driven out ters fo well, that Philbratus was foon obliged to feek for shelter somewhere else, and, on his departure, the Athenians ordered his goods to be fold. Nobody. however, except one person (Callias), would venture to buy and of them, from an apprehension, no doubt, that they would foon be reflored to their proper owner, which accordingly happened in a very short time.

As Megacles and his party had negotiated with Ly-

curgus to turn out Pilistratus, so they now entered into Attica. a treaty with Pifistratus to reinstate him in his principality, as foon as they found Lycurgus would not be who foon implicitly governed by them. To accomplify this, they after reinfell upon a very ridiculous project; which, however, flates him. was attended with the defired fuccefs. They found out a woman whose name was Phya, of a mean family and fortune, but of a great stature, and very handsome. Her they dreffed in armour, placed her in a chariot, and having disposed things so as to make her appear with all possible advantage, they conducted her towards the city, fending heralds before, with orders to fpeak to the people in the following terms: " Give a kind reception, Q Athenians, to Pilistratus, who is so much honoured by Minerva above all other men, that the herfelf condescends to bring him back to the citadel." The report being univerfally spread that Minerva was bringing home Pilistratus, and the ignorant multitude believing this woman to be the goddess, addressed their prayers to her, and received Pilitratus with the utmost. joy. When he had recovered the fovereignty, Pifffiratus married the daughter of Megacles as he had

promiled, and gave the pretended godden to his for Hipparchus and gave the pretended godden to his for Printrative and not tone many the kingdom to which priven out he had been existed as the stage a manner. He had been children by he many a stage of the stage of time; has been godden by he former with the stage of the the whole family of Regarden was represented by the Athenison, he thought proper to let his new angula remain in a flate of perpenual widowbood. This the patiently bore for longe time, but at left acquisited hardstrive. An affirmation prictions could not fail to be likely the prepared. This prevented their meet-Attica. felves to agriculture. ing together, and caballing against him in such bodies as they had been accustomed to do. By this means also the territory of Athens was greatly meliorated, and great plantations of olives were made over all Attica, which had before not only been destitute of corn, but also bare of trees. He also commanded, that, in the city, men should wear a kind of sheep-skin vest. reaching to the knees; but so intolerable were the laws of Pifistratus to his subjects, that this kind of garment in fucceeding times become proverbially the habit of flavery.

As prince of Athens, Pifistratus received the tenth part of every man's revenues, and even the fruits of the earth; and this also, though for the service of the flate, feemed to the Athenians a most grievous burden. In fhort, though Pifistratus behaved in all respects as a most excellent prince, his subjects fancied themfelves oppressed by tyranny, and were perpetually grumbling from the time he first ascended the throne to the day of his death, which happened about 33 years after he had first assumed the sovereignty, at of which time, according to Anitate, he reigned 17

er the approaches to a value being a see to chicas were allowed to appear a arms, they hand attempt to reflore Adiens to its former liberty. In this they imagined that they thould find themlelves feconded by the whole body of the people. But when the day appointed was come, they perceived one of their number talking very familiarly with Hippias; and chaifearing that they were discovered, they immediately fell upon Hipparchus, and despatched him with a mulstride of wounds . In this exploit the people were fo far from feconding them, as they expected, that they fuffered Harmodius to be killed by Hipparchus's guards, and feizing Aristogiton themselves, delivered him up to Hippias. Some time afterwards, however, the refpect they paid to these two young men exceeded all bounds. They caused their praises to be sung at the Panathenma, forbade any citizen to call a flave by either of their names, and creeted brazen statues to them in ' the forum; which statues were afterwards carried into Persia by Xerxes, and sent back from thence by A-rators exlexander the Great, Antiochus, or Selcucus, for au-travagantly thors are not agreed by which. Several immunities honoured. and privileges were also granted to the descendants of these two patriots, and all possible means were taken to render their memory, venerable and respected by poflerity.

Hippias being now fole mafter of Athens, and pro-Cruelty of bably exasperated by the murder of his brother, began Hippias. to alter his conduct greatly; and treat his subjects in an oppreffive and cruel manner. He began with torturing Aristogiton, in order to make him confess his accomplices that this proved fatal to his own friends : for Aristogiton impeaching such as he knew to be best affected to Hippias, they were immediately put to death; and when he had deftroyed all those he knew, at lait told Hippias, that now he knew of none that deferved to fuffer death except the tyrant himself. Hippias next vented his rage on a woman named Leana, who was kept by Aristogiton. She endured the torture as long as the could; but finding herfelf unable to bear it any longer, the at last bit off her tongue, that the might not have it in her power to make any discovery. To her the Athenians erected the statue of a lioness, alluding to her name, without a tongue, on which was engraved Luitable inscription.

After the conspiracy was, as Hippias thought, thoroughly quashed, he fet himself about strengthening his government by all the means he could think of. He courseded leagues with foreign princes, increased his revenues by various methods, &c. But these precau-Born were of little avail; the lenity of Pifistratus's government had alone supported it; and Hippias purfuing contrary methods, was deprived of his fosereignty in less than four years after the death of his

brothera. 65 Megacles, who were styled Alemaonida, and had fet-ven out of the Liplydrum. In times of discontent, which at Athens; sthers were very frequent, this family was the com-diffuge of all who fled from that city; and at lail thought of a method of expelling the Pififratide to the complete was as follows: They agreed with the control was as follows: They agreed with the control was as follows: They agreed with the control was as follows: They agreed their than the manner transfer magnificent manner than the bound to do; for having agreed only to foll the four of common flone, they built it of Parian harble. At the fame time they corrupted the pro-pheters Pythia, engaging her to exhort all the Lace-demonians that came to confult the oracle either in behalfs of the flate, or their own private affairs, to atstriens were very frequent, this family was the combehalfsof the flate, or their own private affairs, to attempt the delivery of Athens. This had the defired effeet :5the Lacedemonians, surprised at hearing this admonition inceffantly repeated, at last resolved to obey the divine command, as they imagined it to be; and fent Anchimolius, a man of great quality, at the head of an army into Attica, though they were at that time in league with Hippias, and accounted by him his good friends and allies. Hippias demanding affiliance from the Thessalians, they readily sent him 1000 horse,

4 M 2

under the command of one of their princes named Cin The Lacedemonians being landed, Hippias fell upon them to fuddenly, that he defeated them with great flaughter, killed their general, and forced the thattered remains of their army to fly to their ships. The Spartans, incenfed at this unfortunate expedition, determined to fend another army, into Attica: which they accordingly did, foon after under their king Cleomenes: and he having, at his entrance into the Athenian territories, defeated the Thesfalian horse, obliged Ulippias to that himself up in the city of Athens, which he was foon after forced to abandon altogether. He was, however, in no want of a place of refuge; the Theifalian princes inviting him into their country, and the king of Macedon offering his family a city and territory, if they chose to retire into his domimions. But Hippins chose rather to go to the city of Sizeum, which Palifiratus had conquered, and deft to After the expulsion of the Pilistratide, the Athenihis own family.

66 And retires te Sigeum.

67 Try laction on Athens.

and did not long enjoy the quiet they had proposed to themselves. They were quickly divided into two factroom; at the head of one was Clyfthenes, one of the chaef of the Alemeonida; and of the other, Ifagoras, a a an of great quality, and highly in favour with the Atheman nobility. Clyfthenes applied himfelf to the people, and endeavoured to gain their affection by increating their power as much as pollible. Ifagoras percriving that by this means his rival would get the beta, ter applied to the Lacedenonians for affiltance, revise ing at the fame time the old flory of Megacles's far, college, and infilling that Clyfthenes ought to be bas The Space withed as being of the family of Megacles. Cleomones, time support king of Specta readily came into his measures, and fudge Hagorus; deal; despatched an herald to Athens with a declared tion of war in case all the Alemmonida were not immedictely banished. The Athenians did not helitates to bamili their benefactor Clyfthenes, and all his relagtions; but this piece of ingratitude did not antiquers their purpole. Cleamenes entered Attica at the agent. of a Sportan army; and, arriving, at Athens, conderner d' to banithment 700 families more than what had been fent into exile before. Not content with this he would have diffolved the fenate, and vefted the car-vernment in 300 of the chief of Hagoras's faction; This the Athenians would by no means submit to the therefore took up arms, and drove Chomenes soft he troops into the citadel, where they were believed two days. On the third day Chomeses in the condition that all those who were in the present thould retue unmulefted. This, though agreed to was not performed by the Athenians. They fell upon fuch as were separated from the army, and puttien to death without mercy. Among the number of thole flain on this occasion was Timelitheus the brother of

hut with-

Cheomenes himfelf.
The Spartan king was no looner withdrawn from our faccels, Athens, than he formed a strong combination in fayour of Hagoras. He engaged the Bootians to attick Attica on the one fide, and the Chalcidians on the other, while he at the head of a powerful Spartan army entered the territories of Eleufion. In this difirels, the Athenians, not being able to cope with fo many enemies at once, refolved to fuffer their territories to be ravaged by the Chalcidians and Boxo-

tians, contenting themselves with opposing the army. Artica, commanded by Cleomenes in perfon. But this powerful confederacy was quickly diffolved: the Corinthians who were allied with Cleomenes, doubting the justice of their cause, returned home; his other allies likewife beginning to waver, and his colleague Aritton, the other king of Sparta, differing in fentiments, Cleomenes was obliged to abandon the enterprise. The Spartans and their allies being withdrawn, the Athemians took a tevere revenge of the Bootians and Chal-Bootians cidians, totally routing their forces, and carrying offand Cha a great number of prisoners. The prisoners taken in cidians de this war were put in irons, but afterwards fet at liber-feated. ty on paying a ranfom of two mine per head. Their fetters, were however, hung up in the citadel; and the Athenians confecrating the tenth of what they had received for ranfom, nurchaled a finine, representing a chariot and four horses, which they set up in the portice of the citadel, with a triumphant inscription 100 in token of their victory.

These indignities rousing the Benotians, they immediately vowed revenge; and engaged on their fide

mediately vowed rawings; and engaged on their lide the people of Assistantial of had a lighter him harred attraction as a lighter of their natural of the Assistantial of their natural of the Assistantial of their natural of their sections of their while their was believed their sections of their while their was believed their sections of their which, he lidd be had found in the estaded of Athenes while his was belieged therein a the surpost of their stable in figure to their stable in figure to the first intends to their stable in the surpost of their stable in the priority of the figure to the priority of their stable from Athenes of the priority of the p

the Greeks very dear, as it brought upon them the whole power of the Perhan empire ; for no fooner did the king of Perlia hear of the affiltance lent from Athere to his rebellious subjects, than he declared himfelf the fwom cuemy of that city, and folemnly befought God that he might one day have it in his powerto be revenged on them.

The lonian war being ended, by the reduction of that: country again under the Perfian government, the king . of Persia ient to demand earth and water as tokens of fubmission from the Greeks. Pet liaiu

Activa accorded the ushar starts of this island of treachery towards Greece, and a war was carried on with them for a long time. How it ended we are not informed, but its continuince was fortunite for Greece in general, as, by tauting them to war, and let affairs in particular, it prevented the while of the Grecian flates from being fullowed up by the Piliais who were now about to invade them.

Belide, the dilpl aftire which Darius had conceived against the Athenians on account of the affiltance they had afforded the lonians, he was further engaged to an expedit on scannil Greece by the intrigues of Hippias. H prias me Immediately on his a turning unfoccessfully from Lapla to th cellemon, as above related, Idippins passed over into Alia, went to Artaphenes governor of the adjacent provinces belonging to the Erhan king, and excited him to make war upon his country, promiling to be obedient to the Perlian monarch provided he was reflored to the principality of Athess. Of this the Athemans being appriled, fent amballadors to Artaph rues, defining leave to enjoy their liberty in quiet;

Action 1 in Committee
Committee consistent and the second states of the second seco the Eretrain, generously mormed the Athenian commanders that they might return home. I They secondangly retired to Oropiis, by which means they escaped deftruction a for Eretria beings from after betrayed to the Perlians, was pillaged, burnt, and ris anhabitants fold for Slaves.

On the news of this diffiler the Athenians immediately drew together all the forces the were able, which after all amounted to no more thin 9000 men Thele, with 1000 Platzans who afterwards joined them, were commanded by ten general officers, who had

equal power; among whom were Miltiades, Anfindes, Attica, and Themistocles, men of distinguished valour and great abilities. But it being generally imagined that fo fmill a body of troops would be unable to relift the formidable power of the Perhans, a messenger was deinarched to Sparta to entreat the immediate affillance of that state. He communicated his business to the state nate in the following terms: Men of Lacefemon, the Athenians debre you to affift them, and not to fuffer the most ancient of all the Grecian cities to be enflaved by the barbarians. Eretria is already deflroyed, and Greece confequently weakened by the loss of fo confiderable a place." The affiliance was readily granted; but at the firme time the frecours arrived for flowly that the Athenana were forced to fight without them. In this memorable engagement in the plans of 26 Marathon, whither Hippins had conducted the Perfians, the latter were defeated with the loss of 6300 Mirathon. men, while the Greeks loft only 192. The Perlinus being this drived to their ships, endeavoured to double Cape Speinm, in order to furprile Athens itself before the army could retinn: but in this they were prevented by Miltrades; who, leaving Arifides with I comen to guard the prisoners, returned to expeditiontly with the other 9000, that he was at the temple of Florest , which was but a fmall way distant, before the bul irians could attack the city.

After the bittle, Aritides discharged the trull ie I tegi is of posed in him with the grewell integrity. Thou help contributions much gold and filver in the Perhin camp, in I the tente and thips they had taken wire filled with ill the of riches, he not only forhore toucher, any it is Mindelf, but to the utmost of his power pr v ut d stock from doing it. Some, however, found means to entitle themselves; among the rest, one (ill as, coult r effinan to Ariftides himself. This man be 37 1 hbearer, and, in varue of his office, hav grill ten his head, one of the Perfians took him for a k of ril, in the down at his feet, discovered to him i vil qui try of gold hid in a well. A STATE OF THE STA

Attica. from the maxima of rquity. His downfal was occafioned by the intrigues of Themistocles : who being a man of great abilities, and hating Ariflides on account of the character he deferredly bore among his countryment took all opportunities of infinuating that his rival had in fact made himself matter of Athens without the parade of guards and royalty. "He gives laws to the people (faid he); and what conflitutes a tyrant, but giving laws?" In confequence of this firange argument, a firong party was formed against the virtuous Aritides, and it was refolved to bunish him for to years by the offracism. In this case, the name of the person to be banished was written upon a shell by every one who defreed his calle, and carried to a certain place within the forum enclosed with rails. If the number of shells so collected exceeded 5000, the sentence was inflicted saif not, it was otherwise . When the agents of Themiltocles had sufficiently accomplished their purpole, on a fudden the people florked to the forum defiring the offracion. De of the dewns who had come from a borough in the country, bring ing a shell to Artslides, faid to him, . Write me Ariindes upon this.": Arifides, furprifed, afked him if. he knew any ill of that Athenian, or if he had ever done him any hurt ? " Me hurt ? (faid the fellow, no. I don't fo much as know him; but I am weary and hick at heart on hearing him everywhere called the juil." Arithdes therefore took the shell, and wrote bis own name upon it; and when informed that the offracifin fell upon him, modefly retired out of the forum, faying " I beleech the gods that the Athenians may never fee that day which shall force them to remember Aristides.

After the battle of Marathon, the war with Algina was revived with great vigour; but the Arginetani generally had the superiority, on account of their green naval power. Themistocles observing this, was contimually exhorting his countrymen to build a fleet, not the building only to make them an equal match for the Refinetant but also because he was of opinion that the Personal would soon pay them another visit. At last, the the holdness to propose, that the monty produced by the silver nines, which the Athenian had authorio di vided among themselves, should be applied to the bisile ing of a fleet: which propolal being compiled with 100 galleys were immediately put apparthe focks this fudden increase of the maritime power professionans of faving all Greece from flavery.

but Themitocles defiring to demand continue that monarch fill wider put to death the in-Xerxes king of Perfia lent to demand care for publishing the decree of the king of Peris language of the Greeks; and baving prevalled upon the leveral flates to lay afide their animal city and provide for their common fafety, got himself elected

general of the Athenian army.

When the next and read that the Perfiana were advancing to invade Greeke say the Traits of Thermopylar, and that they were for this purpose trailporting their forces by sea. Themistocles advised his countrymen to quit the city, embark on board their galleys, and meet their enemies while yet at a diffance. This. they would by no means comply with; for which reason The thocles pat himself at the head of the army, and himself accedemonians, marched towards

Tempe. Here, having received advice that the flraits Attice. of Thermopyle were forced, and that both Bootia and Thessaly had submitted to the Persians, the army returned without doing tany thing.

. In this diffress the Athenians applied to the oracle at Delphi: from whence they received at first a very fevere answer, threatening them with total destruction ; but after much humiliation, a more favourable one was delivered, in which, probably by the direction of Themistocles, they were promised safety in walls of wood. This was by Themistocles and the greatest part of the citizens interpreted as a command to abandon Athens, and put all their hopes of lafety in their fleet. Upon Athens athis, the opinion of Themistocles prevailing; the great-buildoned est part began to prepare for this embarkation; and by its inliahad money distributed among them by the council of bitante, the Areopagus, to the amount of eight drachmas per man: but this not proving fufficient, Themihocles gave out that fomebody had feelin the shield of Minerva; under presence of learching for which, he leized on all the money he could find. Some, however, there were who exefuled for embark with the reft, but railed to themselves for the same of wood and enlanding the oracle is said to the same of th

> After the victories of Pinteriors Stytus, the Lune, nities returned without my appearantonic and begin to sebuild their city in a more magnificent manner than before. Here they were no toones strived than a diff. pute was ready to be commenced about the form of government. The commons, will Themistocles at their head, were for a democracy to which Ariftides, rather than hazard the raising disturbances, consented. It was therefore propoled, that every citizen should have an equal right to the government; and that the archons should be chosen out of the body of the people without preference or dittinction; and this propofal being agreed to, put an end to all discontents for the

prefent more At this time also Themistocles proposed that the city of Arhens should be fortified in the best manner pol-

fible, that it might not be liable to be again deftroyed, when the Persians should take it into their heads to invade Greece. At this proposal the Lacedemonians 92 were exceedingly alarmed; and therefore remonstrated. Themistothat should Athens once be strongly fortified, and the to fortify Persians become possessed of it, it would be impossible Athens, to get them out of it again. At last, seeing these ar and deguments had no effect, they absolutely forbade the A-ceives the thenians to carry their walls any higher. This com-Spartans mand gave great offence: but Themittocles, confidering who of pole the nower of Sparts at that time admited at a Administration the power of Sparta at that time, advised the Athenians to temporize; and to affure the ambaffadors, that they should proceed no farther in their work, till, by an embaffy of their own, fatisfaction should be given to their allies. Being named ambaflador at his own defire to Sparta with some other Athenians, Themistocles for out alone; telling the fenate that it would be for the interest of the state to delay fending the other ambassadors as long as possible. When arrived at Sparta, he put off from time to time receiving an audience, on account of his colleagues not being arrived ; but in the mean time the walls of Athens were building with the utmost expedition; neither houses nor sepulchres being toured for materials; and men, women, children, thrangers. citizens, and fervants, working without intermission. Of this the Lacidemonians having notice, and the ret of the Athenian ambassadors being arrived, Themi-Rocles and his colleagues were furnmened before the who immediately began to exclaim againft the Athenians for their breach of promife. Themitocles denied the charge: he faid his colleagues affored him of the contrary; that it did not become a great flate to give heed to vague reports, but that deputies ought to be fent from Sparta to inquire into the truth of the matter; and that he himself would remain as a hollage, to be answerable for the event. This being agreed to, be engaged his affociates to advise the Athemans to compait the Spartan ambaffadors to fafe cuffody till he be released; after which he publicly avowed the whole transaction, took the scheme upon lundell, and told the Lacedemonians that, all things are lawful for our country." The Spartana feeing no remedy, concealed their refentment, and fent Themstocks home in fafety.

The next year, being the last of the 75th Olympiad, Makes the A semificies observing the inconvenience of the port Persum The port of the port became the port of the proposed Kanthippersand Arithdes to judge of his proposed Kanthippersand Arithdes to judge of his proposed to the people that what Themistocles proposed would be of the utmoit advantage to the state, at the same proposed to the state, at the same proposed to the state, at the same people that when the proposed with the proposed to the state, at the same proposed to the same proposed to the state, at the same proposed to the state, at the same proposed to the same prop time that it might be performed with eale. Upon this they were defired to lay the matter before the fenate; who coming unanimously into their measure, ambissiadors' were despatched to Sparta to infinuate there how proper it would be for the Greeks to have some great port, where a fleet might always watch the deligns of the Perfians; and thus having prevented any umbrage from their first undertakings, the work was set about with fuch expedition, that it was finished before the

transferred from Sparta to Athens, through the haughty behaviour of Paulanias the Lacademonian. He had commanded at Platze, and full enjoyed the fupreme authority in the war which was all this time carrying on against the Persians; but being elated with his facculs at Platza, and having entered into a treafonable correspondence with the enemy, he treated the captains under his command with the greatest haughtinels, giving the preference to the Spartans in such a manuer that the relt of the Greeks could no longer bear his infolence. On the contrary, Ariftides, and Cimon the fon of Miltiades, who commanded the Athenians, by their obliging behaviour gained the favour of every body; fo that the allies, having publicly affronted Paufanias, put themselves under the protection of the Athenian republic; and thenceforward the Athenians, and not the Lacedemonians, had the supreme command.

Aristides taxes Greece with cxtract dinary applaufe.

The Greeks being now fensible that they would always have occasion to be on their guard against the Pertians, and that it was necessary to establish a fund by a common taxation of all the states, Arislides was pitched upon as the only perfor that could be trufted with the power of allotting to each of the tlates its proper quota. This difficult talk he undertook, and executed in a manner unparalleled in the annals of hiflory. All parties were pleafed, and his taxation was flyled the happy lot of Greece. The gross amount of it was 450 talents.

94 Themilto-

ed.

It now came to the turn of Themistocles to expericles bandh- ence the a gratitude of his countrymen. His fervices had been to effential, that the treatment he received may perhaps be a fufficient excuse for modern patricks when they connect their own interest with the ferrior of their country. Themistocles had plainly faxed the thate from rum by his advice; he had diftinguished himself by his valour; had rendered Athens, by his policy, superior to the other states of Greece; and entirely subverted the Lacedemonian scheme of powers Yet notwithitanding all this, he was banished by hite oth acifm, without the fmalleft crime pretended willeft that he was hated by the Lacedemonians, and that he had crected a temple, near his own house, dedicated to Diana, the giver of the best council; intimating that he himself had given the best council for the fafety both of Athens and of all Greece, which was no more than the truth. Nay, he was not only driven out of Ashene, but out of all Greece; fo that he was forced to feet fielter from the king of Perfia, against whom he hash lought with fo much valour. - That monarch mate him a gracious reception stand he was never recalled; bee canfe the Greeks had no occasion for his ferrices. ::

Succell of Cinion Perlians.

The war with Perlin was not were discontinued it the Selving my Thing. This grievoully offended the people Greeks found their advantage in plundering and atagainst the riching themselves with the spoils of the king of Perfia's subjects. For this reason, in the end of the 77th Olympiad, they equipped a navyy under a pretence of relieving such of the Treek cities in Alia as were subjed to the Perlians. Of this fleet Cimon, the fon of Miltiades by the daughter of the king of Thrace, was appointed commander in chief. He had already tafted the justice and generofity of his countrymen, having been thrown into prison for his father's fine, from which he was released by Callias, whom his fifter Elpinice married on account of his great wealth procured by no

very honourable means. He accepted of the command, Attics. however; and gained fuch immense booty in this expedition, that the Athenians were thereby enabled to lay the foundation of those long extended walls which united the port to the city. The foundation was laid in a moorish ground; so that they were forced to fink it very deep, and at a great expence; but to this Cimon himself contributed out of his own share of the spoils, which was very confiderable. He also adorned the forum with palm trees, and beautified the acade my with delightful walks and fountains.

The Persians having soon after this expedition in-He subdues

vaded Cherfonefus, and with the affiltance of the Thra-the Cherfon cians made themselves masters of it, Cimon was fent nesus. against them in a great burry. He had only four ships; but nevertheless with these he took 13 of the Persian galleys, and reduced the whole of the Cherfonefus. After this he marched against the Thracians, who revolting against the Athenians, had made themselves mafters of the gold mines lying between the rivers Nythis and Strymon. The Thracians were quickly obliged to yield patter which the Atheniaus fent a great

ligad to yield; after which the Atheniaus tent a great colony to Amphipolic, a city of Thrace, which for fome time made attemption to the formula before the country of the Edwird great material attemption of the Edwird great material attemption of the formula to the country of the Edwird great material attemption of the Country of the Edwird great attemption of Adiene Greece. Attica. table, where both rich and poor were plentifully entertained. If he met a citizen in a tattered fuit of clothes, he made fome of his attendants exchange with him; or if the quality of the person rendered that kindness unsuitable, he caused a sum of money to be privately given him. All this, however, was not fufficient: he did not concur with every measure of the commonalty; and therefore the popular party determined not to banish him, but to put him to death. The crime laid to his charge was, that by presents from the Macedonians he was prevailed upon to let slip a manifest opportunity of enlarging his conquests, after taking from the Persians the gold mines of Thrace. To this accusation Cimon replied, that to the utmost of his power he had profecuted the war against the Thracians and other enemies of the flate of Athens; but that it was true he had not made any inroads into Macedonia, because he did not imagine he was to act as a public enemy of mankind, and because he was firuck with respect for a nation models in their tail riage, just in their dealings, and firstly seasons in their behaviour towards him and the laborator is his sometymen, looked to if his countrymen looked it 必可に開始は記 their confederates they could be returned the mus, so that the Sparter army could take returned the out engaging them. The Athenians and their confederates amounted to 14,000, and the Spartate to 11,500. The Spartan general, however, and sery willing to hazard a battle, turned afide to Pamagra; serty in Bootia, where some of the Athenians who inclined to aristocracy entered into a correspondence with him. But before their defigns were ripe for execution, the Athenian army marched with great expedition to Tanagra, so that a battle became inevitable. When the Athenians armies were drawn up in order of battle, Cimon predefeated.

against him, that he was forced to retire. Before he de- Attiet. parted, however, he exhorted Euthippus and the rest of his friends to behave in such a manner that they might wipe off the aspersion thrown upon him, as if he had defigned to betray his country's cause to the Lacedemonians. Euthippus desired him to leave his armour, which he did; and a battle ensuing, the Athenians were defeated with great lofs, and Euthippus with the rest of Cimon's friends were all killed in defence of his armour which they had furrounded. Another engagement foon followed, wherein both armies fuffered fo much, that they were glad to conclude a short truce, that each might have time to recruit their shattered forces. £ .,

The scale of fortune now seemed to turn in favour They gain of the Athenians. The Thebans, who had been de-great adprived of the command of Bootia on account of their vantages having fided with Kerkes, were now reflored to it by Spartans. the Lacedemonians. At this the Athenians were fo displeased, that they sent an army under Myronides the for of Galling into Bosotia to overturn all that had been sone. That general was met by the Thebans and their who compoled a numerous and well disciplined army. Nevertheless, though the Athenian army was but a handful in comparison of their enemies, Myrosides gained a complete victory over the allies, in fome Seale more glorious than either that of Marathon or Plates. In these battles they had fought against effeminate and ill disciplined Persians, but now they encountered and defeated a superior army composed of After this victory, Myronides

About this time Pfamitticus, king of Egypt, fent by way of present to the people of Athens 40,000 buthels of wheat; which proved a great misfortune to the city: for Pericles, out of spite to Cimon, who had children by an Arcadian woman, had preferred a law whereby the Athenians of the half blood were disfranchifed; and this law, on account of the distribution of the corn above mentioned, was profecuted with such feverity, that no less than 5000 persons, who till then had been confidered as freemen, were fold for flaves. Number of This piece of cruelty has been of great fervice to the the Athecritics, as by means of it we know exactly the number of Athenian citizens, which at this time amounted to no more than 14,040 persons, though Athens was now aiming at no less than erecting an universal monarchy.

Six years after the conclusion of the peace between Athens and Sparta, a war broke out between the Samians and Milefians about the city of Priency feated under Mount Mycale in Ionia. How this war came to affect the Athenians is not certainly known: but, fomehow or other, this republic was induced to take the part of the Milefians; and the island of Samos was reduced by Pericles, who established there a democracy, and left an Athenian garrison. He was no fooner gone. however, that the Samians, difliking their new form of government, drove out the garrison he had left ; but Perioles quickly returning, belieged and took their city, demolished their walls, and fixed them of the whole expense of the war; part of which he obliged them to pay down, and took hoftages for the remainder. When Pericles returned, he progured himself to be appointed ? to pronounce the public oration in honour of those who fell; which he did with fuch eloquence, that when he came down from the pulpit the women gathered about him, took him by the hand, and crowned him with garlands.

108 War betaveen the Corevrians and Corin-

A little after this commenced the war between the Corcyrians and Corinthians, which by degrees brought the Athenians into those engagements that proved the ruin of their state. The causes of this war were the following: An intestine war breaking out in the little territory of Epidamnum, a city of Macedonia found- Attica. ed by the Corcyrians, one party called in to their affistance the Illyrians, and the other the Corcyrians. The latter neglecting the matter, Corinth was applied a to, as the Corcyrians were a colony from that place. The Corinthians, partly out of pity to the Epidamnians, and partly out of spleen to the Corcyrians, fent a very great fleet to the affillance of the former, by which means that party which had applied to Corinth was thoroughly established. This being resented by the Corcyrians, they fent a fleet to Epidamnum to support the exiles; and accordingly this fleet began to act offensively on its entering the port, the chief commanders having instructions to propose terms of accommodation, to which the Corinthians would by no means agree. The next year the Corcyrians defeated at fca the Corinthians and their allies, and took Epidamnum by ftorm; after which they wasted the territorics of the allies of the Corinthians, which greatly exasperated the latter. At Corinth, therefore, they began to make great preparations for carrying on the war, and pressed their confederates to do the same, that they might be in a condition to retrieve the honour

He they land brought from Delos amounted to so,000 talents i and that though 4000 of these had been expended on the flately gate of their citadel, yet that 6000 were Rill in hand; that they were also entitled to the subsidies paid by the confederate flates; that the flatues of their gods, the Persian spoils, &c. were worth immense sums; that private men were arrived at vast fortunes; and that, confidering their trade by fea, they had a certain annual increase of wealth; that they had on foot an army of 12,000 men, and in their colonies and garrifons 17,000; that their fleet confifted of 300 fail;

whereas the Peloponnefians had no fuch advantages. Attica. For these reasons he proposed as the most feasible and likewife the most equitable satisfaction that could be given, that they would reverse their decree against Megara, if the Lacedemonians would allow free egress and regress in their city to the Athenians and their allies; that they would leave all those states free who were free at the making of the last peace with Sparta, provided the Spartans would also leave all states free who were under their dominion; and that future difputes would be submitted to arbitration. In case these offers should be rejected, he advised them to hazard a war; telling them, that they mould not think they ran that hazard for a trifle, or retain a feruple in their minds as if a small matter moved them to it, because on this small matter depended their safety, and the reputation of their constancy and resolution; whereas, if they yielded in this, the next demand of the Lacedemonians would be of a higher nature; for having once discovered that the Athenians were subject to fear, they would thence conclude that nothing could be defixed to Sparta, whereas a stiff denial in this case would teach them to treat Athens for the future on terms of emulity. He enforced these reasons by showing that their ancestors had always afted on the like principles, had in all cases preferred their glory to their case, and heirliberty to their polleflions.

This was the origin of the Peloponnelian war, which makes to great a figure in ancient history. The framediate preliminary to general hollilities was an attempt of the Thebans to furprise Platea. With this Attempt of they fent Eurymachus with 300 Thebans to ailid han on sech of the Plateans as they had drawn over to their Platea. interest, in making themselves masters of the place. The this defign they succeeded very well at full, the Platmans, who had promifed to open the gates, keeping their words exactly, to that they were instantly in polselice of the city. The other party, however, perenving how small a number they had to content with, ungainquily role upon them, killed a great many, and forced the reft to furrender themselves prisoners their countrymen; but they arrived too late: the Plareasing however, forefeeing that they would waite their country, promised to release their prisoners if they in the The They are The strong of point their tands. On this the 1 her they are like a riddrew, and the Plateaus cruelly put to death malfacted with this prigracts, to the number of 180, with Euryman the prigracts to the number of 180, with Euryman the class of the plate but in case of peace. Attica. cheans; without Peloponnefus, the Megarians, Phocians, Locrians, Beeotians, Ambraciots, Leucadians, and Anactoriaus, declared themselves on their side. On the other hand, the Chians, Lesbians, Platzans, Mesfenians, Acarnanians, Corcyrians, Zacynthians, Carians, Dorians, Thracians, most part of the islands, and all the Cyclades excepting Melos and Thera, with Eubeen and Samos, joined the Athenians.

116 First year of the war.

The Peloponnesian war commenced 431 years before The Lacedemonian army was affembled at the ifthmus, and confilted of no less than 60,000 men; but before Archidamus king of Sparta, who commanded in chief, would enter Attica, he despatched a herald to Athens. The herald was fent back without any answer, by which all hopes of peace were cut off. As Archidamus was a friend to Pericles, the latter apprehended that he might forbear plundering his effates. With this he immediately acquainted the people; telling them at the same time, that in such a case be made a prefent of his lands to the public. He then advised the citizens to take no care of defending their country feats, but to attend only to the city, buly themselves in the equipping of ships, and settle a thorough refolotion not to be intimidated with the first evils of war. The propoful the Athemans readily complied with, and appointed Perioles commander in chief, with nine more generals to affift him.

The first year, the Spartan army committed great ravages in Attica, Pericles having no force capable of oppoling it, and refuting to engage on difadvantageous terms, notwithstanding prodigious clamours were raised against him by his countrymen. The allies, howevery had no great reason to boall of the advantages they gained this year: an Athenian flect ravaged the coafts. of Peloponnesus; another insested the Locrians, drayer out the inhabitants of Ægina, and repropled the illand, from Athens. They likewife reduced Cephalenia, and! force towns in Acarnania and Leucus which had declared for the Lacedemoniane; and in the autumnet when the Peleponnefians were retired, Pericles enteris the Megarian territory, did all the milchief that could be expected from a provoked enemy.

717 Second усаг.

The forme of the second year was very fatal to Ax thens by a dreadful plague which destroyed great torms bers of the citizens, while the Pelepounchans under Archidamus wasted every thing abroad. In the milit. of these diffresses, however, Pericles retained his courage, and would fuffer none of his countrymen to fir without the city either to escape the plague or infelt; the enemy. He cauled a great fleet to be equipped. on board which he embacked 4000 foot and 900 harfes. with which he failed to Epideurus. Upon this the enemy withdrew their forces out of Attica ; but Peris cles was able to do no great matter on account of the plague, which made to great havock among his menthat he brought back to Athens only 1500 of the 4000 Ath mans he carried out, By this misfortune the Athenians were thrown into despair; they immediately sued for peace, which the Spartans were now too proud to grant; then turning their rage upon Pericles, they dilmiffed and fined him. Soon after, Pericles's children and almost all his relations died of the plague; fo that this great flatefman was overwhelmed with melancholy, and for formatime that handelf up from public view: at laft, through the perfusion of Alcihiades and some others,

he showed himself to the people. They received him Atties. with acclamations, and at his request repealed the unjust law he had made, whereby all Atheniaus of the Pericies resthalf blood were disfranchised, and then reinstated him one for the in all his former honours. Hereupon he circuled the quests the only fon he had left, who before had been counted a law. baffard on account of his mother being a Milefian.

This year also the island of Zacynthus was wasted by the Peleponnelians; and the city of Potidaa fubmitted to the Athenians, after the inhabitants had been driven to fuch extremity as to feed upon human flesh. The Athenians permitted the men to depart with one garment, and the women with two; after which, the town was repeopled by a colony from Athens.

The third year of the Peloponnelian war was re-Third year. markable for the death of the great Pericles, who was arm taken off by the plague. Platza also was besieged by Archidamus; but without success, even though the Platra greatest part of it was fet on fire; the Platarans re-besieged. folving to submit to every kind of mifery rather than abandon the Athenian cause. In the end, therefore, theking of Sparts was obliged to turn the sege into a blockade, and having shrown up an intrenchment for-tified with the fact of the a sufficient number of men to guild block and then returned back to Po-lopowness.

plague at

Athens.

124 Plato:a aken and cazed.

Attica. mer the Athenians seized the island of Minoas, lying over against the territory of Megara; and likewise the port of Nifen, which last they fortified, and it proved afterwards a place of the utmost importance to them. At this time also the Platerans, driven to the last extremity, furrendered to the Lacedemonians, by whom they were, to the number of 208, including 25 Athenians, put to death, and their women fold for flaves. Their city was foon after razed by their implacable encmies the Thebans, who left only an inn to show where it flood. The fame of Platica, however, induced Alexander the Great afterwards to rebuild it.

Sedition of Corcyta.

In this year happened the famous fedition of Corcyra, whence other feditions, when their effects rendered them terrible, have been called Corcyrian. It hath been already observed, that the war between the Corcyrians and Corinthians brought on the general war throughout Peloponnesus. A great number of Corcy. rians were in the beginning of this war carried away prisoners into Peloponnesus, where the chief them vere very well treated, but the rest sold for saves. The reason of this conduct of the Coriothians was a design they had formed of engaging this Correction to influence their country property and their allies. With this reason to the conduct of the same and the which save and the same and the which save and the same were very well treated, but the reft fold for laves. Bicity. latal than all the rest. The inhabitants of Sicily were split into two factioning the one called the Dorie, at the head of which was the city of Syracule; the other the Ionic, which owned the Leontines for their chiefe? the latter perceiving themselves too week without for reign aid, sent one Gorgias, a celebrated orator, to apply to Athens for relief; and he by his fine speeches so captivated the giddy and inconstant Athemans, that they ran headlong into a war which they were unable to maintain while engaged with all the Peloponnefians. Enticed by this new profpect, therefore, and

grafping at the conquest of Sicily, as well as of all Greece, they feat a fleet to the affiliance of the Leontines, under the command of Luchetes and Chabrias; and they were no fooner failed, than another fleet for the same purpose was begun to be sitted out. All

this time the plague continued to rage with great vio-

The fixth year of the Peloponnesian war was remark-Sixth year. able for no great exploit : Agis the fon of Archidamus, king of Sparta, affembled an army in order to iuvade Attica, but was prevented from to doing by many

great carthquakes which happened throughout Greece. The next year, however, he entered Attica with his army, while the Athenians on their part fent a fleet Seventh under the command of Demoithener, to infelt the coafts yearof Peloponnesus. As this fleet passed by Laconia, the Pylus forticommander took notice that the promontory of Pylus, Atheniana

which was joined to the continent by a narrow neck of land, had before it a barren illand about two miles in circumference, in which, however, there was a good and fafe party all winds being kept off by the head

land, or by the ille. These advantages made him apprehend, that a garrison left here would give the Pelopremenades to much trouble, that they would find it more ativifable to protect their own country than to invade

that of their seighbours. Accordingly, having raifed a strong fortification, he himself with five ships staid to defend it, while the rest of the fleet proceeded on their intended expedition. On the news of this event, Befog. of the Peloponnefian army immediately returned to beflege

Pylus. When they arrived before the place they took possession of the harbour, and then caused a choice body of Spartans take possession of the island of Sphasteging after which they attacked the fort with great vi-

therein, after which they befreged the Spartons in deltroyed, Sphacteria. The Peloponnesians now began to treet with their enemies, and a truce was concluded during the time that negotiations were carried on at Athens. One of the acticles of this truce was, that the Peleponsehans should deliver up all their ships, on condition of

having them punctually returned in case the treaty did not rake effect." The Athenians having heard the Spartes ambaffadors, were inclined to put an end to this defendive war: but Cleon, one of their orators, swarm and obstinate man, persuaded his countrymen to wift on very unreasonable terms; upon which the

in believes returned, and by fo doing put an end to 137 the recovery the recovery velleis but the Athenians refused to deliver them, Athenians. under pretence of their having broke the truce.

Hoftilities being thus recommenced on both fides, They atthe Lacedemonians attacked the Athenians at Pylus, tack Sphare while the latter attacked the Spartans at Sphaeteria. terra. The Spartans, though but a handful of men and under every imaginable difcouragement, behaved with such bravery, that the fiege proceeded very flowly, fo that the people of Athens became very unexly. They be-Cleon the gan then to wish they had embraced the offers of the orator Spartans, and to rail vehemently against Cleon who appointed to excuse himself, said, it would be easy for the government of the forces they were at that time fonding to of the forces they were at that time fending, to the Spartaus in the ifle, and reduce them at once. as, who had been appointed to this command, reflied, that if Cleon believed he could do fuch great

MARIS

Artica. he would do well to go thither in person: the latter, imagining this only meant to try him, faid he was ready to go with all his heart; whereby Nicias catched him, and declared that he had relinquified his charge. Cleon thereupon faid, that he was no general; but Nicias told hun that he might become one; and the people, pleafed with the controversy, held the orator to his word. Cleon then advancing, told them he was fo little afraid of the enemy, that, with a very inconfiderable force, he would undertake, in conjunction with those already at Pylus, to bring to Athens the Spartans who gave them fo much trouble in 20 days. The people laughed at these promises: however, they furnished him with the troops he defired; and to their furprife, Cleon brought the Spartans prisoners to Athens within the time appointed.

This fummer, likewise, an Athenian fleet was fent to Sicily, with inftructions to put in at Coreyra, and affift the government against the Lacedemonian faction which fill subfilled in that island. This they effectually performed; for by their means the exiles fell into the hands of the other party; these they imprisoned; and then drew them out by 20 at a time, to fuffer death, which was inflicted with all the circumflances of cruelty that party tage could fuggest. When only 60 remained; they entreated the Athenians to put them to death, and not to deliver them up to their countrymen; but upon this the Corcyrians furrounded the place where they were confined, endeavouring to bury them under their daits; upon which the unhappy captives all put an end to their own lives.

In the eighth year Nicias reduced the ifle of Cythera on the coult of Luconia; as likewife Thyraa, on the confines of that country. The latter had been given to the Æginetans when expelled from their own country by the Athenians; and they were now condemned to death, as inveterate enemies of the Athenian state and vation .- In Sarily, one Hermocrates of Syracuse pertunded all the inhabitants of the island to adjust their differences among themselves; upon which the Atherman generals returned home, and for so doing two of them were banished, and the third sentenced to pay & heavy fine.

The Athenians next laid fiege to Megara, under the conduct of Hippocrates and Demosthenes; but Brafidas a Spartan general coming to its relief, a battle enfued, by which, though neither party got the better, the Lacedemonian faction prevailed in Megara, and many who favoured the Athenians were forced to withdraw. After this, such as had been banished for adhering to the Lucedemonians were allowed to return, on their taking an oath to forget what was past, and attempt nothing that might diffurb their country. As foon as they were fettled, however, they forgot their oath; and canfing 100 of those who were most obnoxious to be apprehended, forced the people to condemn them to death. They then changed the whole form of government, introduced an oligarchy, and possessed

138 the exest of the supreme power.

Abernian La Boxotia some commotions were raised in favour of lose their the Athenians; but their generals Hippocrates and Demosthenes being defeated by the opposite party, all hopes ceafed of the Athenian power being established in Breotia. In the mean time Brasidas reduced the city of Amphipolis, which greatly alarmed the Athenians, who thereupon fint new supplies of men, money, and fhips, to the Macedonian coall; but all their care could not prevent a great defertion from their into eff in those parts, where the valour and conduct of Brasidas carried all before him.

In the ninth year, the Sportans made new proposals Ninth year. of peace, which the Athenians were now more inclined A truce to accept than formerly; and finding their affairs very and broken. much unfettled by the lots of Amphipolis, a truce for a year was quickly agreed on, while negotiations were in the mean time carrying on for a general peace. This pacific feheme, however, was very forn overthrown by the following accident in Thracs. The city of Scione and that of Menda, revolted to Brafidas; who, knowing nothing of the truce, fought to draw over Potidiza alfo. The Athenians, pretending that Scione revolted two days after the truce was concluded, made heavy complaints, afferting that this was a breach of the truce, and that both it and Menda should be restored to them. This not being effected by negotiations, an army was fent against the two cities by which Menda was reduced; but Scione making an obilinate defence, the fiege was turned into a blockade.

In the tember of Branda made an attempt upon Tenth year. Porides a Milit having faith, the Athenians began to feated and recover fome relatings. The trace expiring on the day killed by of the Pythian games. Cleon perfused the Athenians Brandas, to fend an army into Thrace under his want mannand. It confilled of 1200 foot and 300 horle, all Athenian citizens, who embarked on board 30 galleys. Brafidas had an army much inferior about observing that the Athenian general was become carelels, and neglected discipline, he attacked him. In this engagement Cleon was villed, and the Athenians defeated with the lold of the them, while the Spartans lost only seven; but among these was their brave commander Brasidas, whole destricted them almost as much as the loss of their simply did the Athenians.

one of their best arealors, and one who had been very your posce. induffrious to promoting the war, they were now much more difpoled than formerly to heatken to terms of acsimmodation. Amongs the Spartans too, there was party, at the head of whom was Philonan their kinds who carnight withind for peace; and as Nicias laboured no lefe alliduously at Achien to bring about this firable event, a peace was at last concluded for lifty years between the two nations. The conditions were, that a relitution of places and prisoners should be made on both fides; excepting that Nifxa should remain to the Athenians, who had taken it from the Megarians. and that Platza should continue with the Thebans, because they absolutely would not give it up. The Borotians, Corinthians, and Megarians, refused to be included in this peace: but the rest of the allies yielded to it; and it was accordingly ratified, receiving the name of the Nician peace, from Nicias who had so vigoroufly promoted it.

By this means, however, tranquillity was far from New difbeing reflored. Such of the flates of Peloponnelus as contents were diffatisfied, began immediately to league among themselves, and to set on foot a new confederacy, the head of which was to be the flate of Argos. The Lacedemonians, too, found it impossible to perform exactly the articles of agreement; the city of Amphipolis

Sparran Puty prevails in Megara.

power in

bæstia.

Attica. in particular, absolutely refused to return under the Athenian government; for which reason the Athenians refused to evacuate Pylus. In the winter, new negotiations were entered into on all fides, but nothing determined, and univerfal murmuring and difcontent took Heightened place. These discontents were not a little heightened by Alcıby Alcibiades, who now began to rival Nicias, and hinden perceiving the Lacedemonians made their court mostly to his rival, took all opportunities to incenfe his countrymen against that nation. Nicias, on the other hand, who wished for nothing so much as peace, used all his endeavours to bring about a reconciliation. The artifices of Alcibiades, however, added to the turbulent and haughty disposition of both nations, rendered this imposlible; fo that though Nicias went on purpose to

T44 His meafaces for the fafety of Attica.

Sparta, he returned without doing any thing. Alcibiades having thus disposed every thing according to his wishes, and a war being inevitable, he began to take the most prudent methods for preferring his country in fafety. With this view he entered into a league for 100 years with the Argives, which he hoped would keep the war at a diftance; he next paffed over into the territories of Argos, at the head of a considerable army; and laboured, with a the few and at Patrie, to perfuse the people to build wall to the fea, that fo they might the more easily reading affidance from the Attention. But though great preparations for war were now made, nothing was undertaken this year; only the Argives thought to have made themselves mafters of Epidaurus, but were hindered by the Lacedemonians putting a garrifon into its. ...

Fourteenth . The next year (the 14th after the Peloponnefian war year. War was first begun) a Spartan army, under the command of Agia, entered the territory of Argos, where the conrenewed. federate army lay; but just as the engage was about to begin, a truce was indeenly contrast by two of the Argive generals and the king of floating. With this neither party was pleased, and, total the king and generals were very ill protect by floating to the arrival of some fresh troops from Attens, therefore, Athousing the Argives immediately broke the truce : but the aldic. defeat had army was foon after defrated with great flaughter d sertion by Agie; notwithflanding which, however, the Eleans frong party in Argus joined the Lacedemonians; in confequence of which that city renounced her alliance with Athens, and concluded one with Sparta for fifty years. In compliment to their new allies, also, the Argives abolished democracy in their city, establishing an ariflocracy in its place, and affifted the Lacedemonians with a confiderable body of troops to force the

147 l'ifteenth year.

In the beginning of the 15th year, the Argives, with a levity feemingly natural to all the Greeks, renounced their alliance with Sparta, abolished aristocracy, drove all the Lacedemonians out of the city, and renewed their league with Athens. The Athenians, in the mean time, being convinced of the treachery of Perdiccas king of Macedon, renounced their alliance with him, and declared war against him.

Sicyonians to do the fame.

148 Sixteenth

Next year Alcibiades terminated the disputes in the year. Me-city of Argos, by the bandliment of the Spartan faclos reduced tion: after which he failed to the island of Melos, whose inhabitants had acted with the greatest invete-Atheniana racy against his countrymen: pereciving, however, that the reduction of the island would be a work of time, he Atticaleft a confiderable body of forces there, and returned to Athens. In his absence the capital of Melos surrendered at diferction, and the inhabitants were treated with the utmoil cruelty; all the men capable of bearing arms being flaughtered, and the women and children carried into captivity.

In the beginning of the 17th year, Nicias was ap-S. venpointed commander of an expedition against the Syra-Arhaman cusans, along with Alcibiades and Lamachus as colleagues. But while the necessary preparations were mak- Saidy look ing, all things were thrown into confusion by the defa- and Alabicing of the Hermæ, or statues of Mercury, of which ales these there was a great number in the city. The authors of Sparta this facrilege could by no means be discovered, though rewards were offered for this purpole: at last the fulpicion fell upon Alcibiades; and for this weighty reason he was commanded to return from Sicily to take his trial. Alcibiades, however, knew the temper of his countrymen too well to trust himself to their mercy; and therefore, instead of returning to Athens, he field immediately to Sparta, where he met with a gracious reception; while the infatuated Athenians were feverely punished by the loss of their army, generals, and fleet, in Sicily, which the superior abilities of Alcabiades would in all probability have prevented.

The 19th and 20th years of the war were spent by Numeteenth the Athenians in equipping a new fleet in order to re- and pair their vast losses: but Alcibrades hurt their interests twenticth very much, by perfuading Tiflaphernes the Perfuan to league with the Spartans against them; at the same time he perfuaded feveral of the Ionian flates to revolt from Athens, but they were in a fhort time obliged again to submit. Notwithstanding all these services, Alcibiades however, Alcibiades had rendered himicit to hateful to flies to Agis by debauching his wife, that he foon found him-Perhafelf obliged to fly to the Persians, where Titlaphernes gave him a very favourable reception, and profited much by his advice, which was, to let the Greeks weaken one another by their mutual wars, and that the Perfians ought never to fee one flate totally deflioyed, but always to support the weaker party.

When Tillaphernes had acquiefeed with these com . Proposes fels, Alcibiades privately wrote to fome of the officers the aboliin the Athenian army at Samos, that he had been ton of democracy treating with the Persians in behalf of his countrymen, at Athena but did not choose to return till the democracy thould be abolished; and to incline the citizens to comply with this measure, he told them that the Perlian king chiliked as democracy, but would immediately all it them if that was abolified, and an oligarchy encoded in

On the arrival of Pilander and other deputies from the army, with the proposals of Alcibiades, the Athenians without hesitation resolved to overturn that democracy which they had all along to themsouthy de-The issue of their present debate was, that Pifander with ten deputies should return to Alcibiades, in order to know on what terms the king of Persia would make an alliance with them; but that cuming Athenian having perceived that Tiffaphernes was by no means disposed to affist the Athemans on account of their having been lately fuccefsful, he fet up fuch high demands in the king of Perfia's name, that the Athenians of themselves broke off the treat;

¥ 1.

Arrica. and thus Alcibiades preserved the friendship of both partics.

New form of governftablished.

Pilander having engaged the army at Samos in his scheme of overturning democracy, that form of government was abolished first in the cities subject to Athens, and lastly in the capital itself. Pilander's new scheme was, That the old form of government should be totally diffolved: that five prytanes should be elected: that these five should choose 100; and that each of the hundred should choose three; that the 400 thus elected should become a senate with full power; but should occasionally consult with 5000 of the most wealthy citizens, who should thenceforward be esteemed only the people; and that no authority should remain with the lowest class. Though the people were not very fond of this change, those who conducted it, being men of great parts, found means to establish it by force; for when the people were gone out of the city to their ordinary employments, the 400, having each a dagger concealed under his veft, attended by a guard of 120 men, entered the fenate house, diffolved the old fenate, and without ceremony turned them out; after which the commons, not knowing whom to fubmit to, or to whom to apply, made no opposition.

The first step of the new governors was to destroy, all their enemies; who, however, were not very nues merous, fo that little blood was shed. They next fent amballadors to Agis to fue for peace; but he, taking for granted that the Athenians would never defend an oligarchy, gave no answer to the ambassadors, but immediately marched towards the capital with a delign to attack it. On his arrival, however, he was quickle convinced of his millake, being repulsed with tols, and

obliged to retire to his old poft.

In the mean time the Athenian army declared again declare for a democracy; and having recalled Alcibiades, in democracy, vefted him with full power, and infifted on his immediately Alabades, diate return to Athens to reftore the ancient gotel ment. This measure he refused to comply personal personal them to stay where they were, an entire to fave Ionia : he also prevailed on them to sllow forme deputies, who had been fent from the new govern nors of Athens, to come and deliver their medice To these deputies Alcibiades replied, that they have immediately return to Athens, and acquaint the that they were commanded immediately to refign their power and reflore the fenate; but that the species might retain theirs, provided they used it with minds ration.

Great confusion at Athens.

The army

By this answer the city was thrown into the utmost confusion; but the new government party prevailing, ambailadors were despatched to Sparta with orders to procure peace on any terms. This, however, was not to be effected; and Phrynicus, the head of the embally, and likewise of the new government party, was murdered on his return. After his death, Theramenes, the head of the other party, seized the chiefs of the 400; upon which a tumult enfued that had almost proved fatal to the city itself. The mob, however, being at lall dispersed, the 400 assembled, though in great fear, and fent deputies to the people, promiting to fet all things to rights. In consequence of this deputation, a day was appointed for convoking a general affembly, and fettling the state; but when that day came,

news was brought that the Lacedemonian fleet appear. Attica. ed in view, and fleered directly for Salamis. Thus all was again thrown into confusion; for the people, instead of deliberating on the subject proposed, ran in crowds down to the port, and perceiving the Spartans made towards Euboca, a fleet of 36 ships was immediately despatched under the command of Thymochares, Athenian to engage the enemy. This fleet was utterly deseated, stroyed by 22 of the Athenian ships being taken, and most of the the Spatothers funk or disabled; but what was worse, this de-tans. feat was followed by the revolt of all the country of Eubœa except Orcus.

When these dismal tidings arrived at Athens, every thing was given up for loft; and had the Lacedemonians taken this opportunity of attacking the city, they had undoubtedly succeeded, and thus put an end to the war: but being at all times flow, especially in naval affairs, they gave the Athenians time to equip a new fleet, and to retrieve their affairs. One good effeel of this disaster, however, was the putting an end for a time to the internal diffentions of this turbulent manie; informich thes Thucydides the bistorian is of

sease i informed that Thucydides the historian is of success, that the resultic never enjoyed to much quiet as at the points.

the taking of Pylos by the Sportans. The Athenians Pylus. had fent a fleet under the command of one Anytus to its defence: but he was driven back by contrary winds; upon which he was condemned to death, because he could not cause the wind blow from what quarter he pleafed: this fentence, however, was remitted on his paying a vast fum of money. This miffortune was quickly followed by another. The Megarians furprifed Nifæa; which enraged the Athenians fo much, that they immediately fent an army into that country, who defeated the Megarians who opposed them with great flaughter, and committed horrid

These missortunes as yet, however, were overbalanced by the great actions of Alcibiades, Thrafybulus,

Atticor 160 Alcibiates rates Atheus in trauniph.

He is difgraced.

When Alcibiades returned, he and Theramenes. brought with him a fleet of 200 ships, and such a load of spoils as had never been seen in Athens since the conclusion of the Persian war. The people left their city destitute, that they might crowd to the port, to behold Alcibindes as he landed; old and young bleffed him as he paffed; and next tlay when he made a harangue to the affembly, they directed the record of his banishment to be thrown into the sea, absolved him from the curies he lay under, and created him general with full power. Nor did he feem inclined to indulge himself in case, but soon put to sea again with a fleet of too ships. He had not been long gone, however, before all this was forgot. Alcibiades failed to the Hellespont with part of his fleet, leaving the rest under the command of Antiochus his pilot, but with ftrict orders to attempt nothing before his return. This command the pilot paid no regard to, but provoked Lyfander the Lacedemonian admiral to an engagement, and in confequence of his temerity was defeated with the loss of 15 ships, himself being killed in the engagement. On the news of this defeat Alcihiades returned, and endeacoured to absolute the Larceltonniane to a fecond battle the condensity

Cook marks and a second who had butte a completely butter the manufactor hond, entrested them at he more on their grands at well knew Lylander's abilities. They answered the they wondered at his afturance, who was an exile and a ragabond, to come and give buts to them i tellings him, that if he gave them any farther trouble, they would feize and fend him to Athens. At the fame time they looked on victory as so certain, that they confulted what they should do with their prisoners ; which, by the advice of Philocles their general, was, to out off all their right hands, or, according to Plutarch, their right thumbs; and Adiamantus one of their officers rendered himfelf very obnoxious by faying, that fuch idle discourse did not become Athenians. The confequences of fuch conduct may be eafily imagined. Lylander fell unexpectedly upon them, and gained a Vot. II Part II.

most complete victory; Conon, with eight galleys only, Attack escaping to Cyprus; after which Lylander returned to Lampfacus, where he put to death Philocles with 3000 of his foldiers, and all the officers except Adiamantus. This execution being over, he reduced all the cities subject to Athens; and with great civility fent home their garrisons, that so the city might be overslocked with inhabitants, and destitute of provisions, when he came to believe it; which he did foon after by fea, while Agis with a great army invested it by land.

For a long time the Athenians did not fo much as who takes defire a peace; but at last were forced to fend deputies Athens. to Agis, who fent them to Sparta, where no terms could be granted except they confented to demolish their walls. They next fent to Lylander, who after a long attendance referred them to Sparta; and thither Theramenes with some other deputies was immediately fent. On their arrival, they found the council of the confederates fitting, who all except the Spartans gave their votes that Athens should be utterly destroyed; hat they would not confent to the rain of that city, which had delerved to well of Greece. On the return pans of Thermoreies, peace was concluded, on condition, see . therethe long walls and the fortifications of the port thould be demokihed; that they thould give up all their thips but 12, receive all they had banufied, and follow the fortune of the Lucedemonians. These fewere terms were punctually executed. Lylander canfed the walls to be pulled down, all the mutic in his army playing, on that very day of the year on which they restricte Persians at Salamine. He likewise estaan oligarchy expressly against the will of the of the claponnefian war, and the 404th before

Section Lylander had demolished the long walls, The thirty detailications of the Pirsonn, he constituted a tyrant. Actifications of the Piranum, he commuted a fatherty, with power, as was pretended, to the thirty, with power, as was pretended, to the thirty, mide the fate. These controls of famous in history, under the tule of the triangle of the father derived their rife from conquestions. They were all the creatures of Laborate their offices in a father pethat is, with the highest tellmonte is the father of the tellmonte in the father of the tellmonte in the father of the tellmonte is the father of the tellmonte in de de la control rice the december which was accordingly granted them, under the command of Callidius, upon their promile to may the foldier regularly. One of the full Received took was to punish all informers; which, though severe, was popular; but when, through flattery and bribes; they had wholly drawn over Call dius to their party, they fuffered had men to live in quiet, and

turned their rage against the good.

Critics and Therumenes were at the bead of the County and thirty, men of the greatest power and abilities in Plerance-Athens. The former was ambitious and cruel with the the ont measure; the latter was somewhat more merciful; opports the former pushed on all the bloody schemes framed by chancer; his confederates, and carried into execution many of his own; the latter slways opposed them, at find with moderation, at last with vehemence. He faid, that power was given them to role, and not to spoil, the

commonwealth:

Attics. commonwealth; that it became them to act like shepherds, not like wolves; and that they ought to beware of rendering themselves at once odious and ridiculous, by attempting to domineer over all, being fuch a handful of men as they were. The reft, dishking much the former part of his discourse, catched hold of the latter, and immediately chose out 3000, whom they made the representatives of the people, and to whom they granted this notable privilege, that none of them should he put to death but hy judgment of the senate, thereby openly assuming a power of putting any other of the Athenian citizens to death by their own authority. A glorious use they made of this new assumed privilege; for as many as they conjectured to be no friends to the government in general, or to any of themselves in particular, they put to death, without cause, and without mercy. Theramenes openly opposing this, and absolutely refuting to concur in fuch measures, Critias accufed him to the fenate as a man of unfleady principles, fometimes for the people, fometimes against them, always for new things and flate revolutions. Theramenes owned, that he had fometimes changed his meafures, but alleged that he had always done it to ferve, the people. He faid that it was folely with this view he made the peace with Sparta, and accepted the office of one of the thirty: that he had never opposed their meatures while they cut off the wicked; but when they Legan to deflroy men of fortune and family, then he owned he had differed with them, which he conceived to be no crime against the state.

168 Therain no put to death

While Theramenes was fpeaking, Critias withdrew, perceiving that the fenate were thoroughly convinced of the truth of what Theramenes had faid : but he quickly returned with a guard, crying out, that he had firuck Theramenes's name out of the lift of the 3000; that the tenate had therefore no longer cognizance of the emfe, when the thirty had already judged, and condemand him to death. Theramenes perceiving that they intended to feize him, fled to the altar, which was in the midit of the fenate house, and laying this hands thereon, faid, " I do not feek refuge here because I expect to escape death, or defire it; but that, tearing me from the altar, the impious authors of my murder may interest the gods in bringing them to speedy judgment, and thereby reftore freedom to my country The guards then dragged him from the altar, and the ried him to the place of execution, where he drank the poilon with undaunted courage, putting the people in mind with his laft breath, that as they had firuck his name out of the 3000, they might also strike out any of theirs. His death was followed by a train of murdets, so that in a short time 60 of the worthiest and most eminent citizens of Athens fell by the cruelty of the thirty. Among these, the most pitied was Niceratus the fon of Nicias; a man univerfally beloved for his goodness, and universally admired for his virtucs. As for the Spartans, they, losing their former generofity, were extremely pleafed with thefe things, and by a public decree commanded that fuch as fled from the thirty tyrants should be carried back bound tonAthens: which extraordinary proceeding frightened (Geece; but the Argives and Thebans only had mage to oppose it: the former received the Atheexiles with humanity and kindness; the latter puwith a mulch such of their citizens as did not

rife and refene the Athenian prisoners, who in pursu- Attica. ance of the Lacedemonian decree were carried bound through their territories.

Thrafybolus, and fuch as with him had taken shelter in the Theban territory, refolved to hazard every thing, rather than remain perpetual exiles from their country; and though he had but 30 men on whom he could depend, yet confidering the victories he had beretofore obtained in the cause of his country, he made an irruption into Artica, where he feized Phyla, a castle at a very Ti rashbusmall distance from Athens, where in a very short space has seizes his forces were augmented to 700 men; and though Phylathe tyrants made afe of the Spartan garrison in their endeavours to reduce him and his party, yet Thrafybulus prevailed in various skirmishes, and at last obliged them to break up the blockade of Phyla, which they had formed. The thirty and their party conceiving it very advantageous for them to have the possession of Eleufina, marched thither, and having perfuaded the people to go unarmed out of their city, that they might number them, took this opportunity most inhumenty to murder them. The forces of Thrafybulus increating daily, he at length possessed himself of the Piroun, which he fortified in the best manner he could; but the tyranta heing server and to drive him from thence, came from against him with the utmost force they could raise. Threstybulus defended handels with great obstinacy; and in the end they were forced to retreat, having loft before the place not only a great number of their men, but Critiss the president of the Critiss kills thirty, another of the fame body; and one who had been ed. a captain of the Pirmum.

When they came to demand the dead from Thrafybulus in meder for their interment, he caused a crier be indicated but to make a thorr speech in a very loud voice the proper contact a thorrespeech in a very loud voice the proper cathering them to consider, that as they were being them as they were being the property and there who drapht to preserve their letters also in the preserve their preserve their preserve of think in the round of the preserve their bettern, they ought rather to conside how all the preserve their preserve they ought rather to conside how all the preserve their preserve they ought rather to conside how all the preserve their preserves the preserve the preserves differences ought to be composed, and especially much ed find shemisives of those bloody tyrants, who, in t fhore time they had had the administration in their mines, find defroyed more than had fallen in the Pelo-population wer. The woods, allough moved by the differ-courter differed among the afelies; the confequence of which was that they expelled the thirty, and choic ten The tyrants men but of each tribe to govern in their flead, where expelled. upon the tyrants retired to Eleufina. The citizens, however, though they changed the government, made no agreement with those in the Pirzum; but fent away deputies to Sparta, as did also the tyrants from Eleufina, complaining, that the Athenians had revolted, and defiring their affiftance to reduce them. The Spar-Attempt of tans fent thereupon a large fum of money to encourage the Spartans their confederates, and appointed Lylander commander to reduce in chief, and his brother to be admiral; refolving to cond time. fend fea and land forces to reduce Athens a fecond time; intending, as most of the Greek states suspected. to add it now to their own dominions. It is very probable that this defign of theirs would have taken effect, if Paulinias king of Sparta, envying Lylander, had not relolved to obflruct it. With this view, he procured another army to be raifed against the Athe-

Artical nians, of which himself had the command, and with which he marched immediately to beliege the Pineum. While he lay before the place, and pretended to attack it, he entered into a private correspondence with Thrafybulus, informing him what propositions he should make in order to force the Lacedemonians, who were fuspected by their allies, to grant them peace.

How fru-Thated.

The intrigues of Paufanius had all the success he could wish. The Ephori who were with him in the camp concurred in his meafur +: fo that in a fhort space a treaty was concluded on the following terms: That all the citizens of Athens should be restored to their houses and privileges, excepting the thirty, the ten which had fucceeded them and who had acted no lefs tyrannically than they, and the eleven who during the time of the oligarchy had been conflicted governors or keepers of the Piraum; that all should remain quiet for the future in the city; and that if any were afraid to trust to this agreement, they should have free leave to retire to Eleulina. Paulanias then marched away with the Spantan army, and Thrafybulus at the head of his forces marched into Athens, where having laid down their arms, they facrificed with the self of the citizens in the temple of Minerva, after which the citizens in the temple of Minerva, after which the citizens the self of the exiles to Eligibet having endeavoured by the highest money to reason at any of foreigners, by whose sid they might recover the authority they had loft : but first depending on their friends in the city, they feat fome of the principal persons among the instructed them to fow jealouses and excise discords instructed them to low leadables and incite estocists among them. This the latter quickly predicting, put these persons to death; and then among matter in these at Eleusina, that shele contentions would be incited to the entry, they offered intrictions to nair an action of policies, which they would configurate in an action of policies. This being according to the this statement is also being according to the content of th

turned to the only more all amoremes were summer, and both incline well religiously observed the again-inest they had stude, and steerby thoroughly relegible this face. In this whole cranicalion, the misse of Three Spirites described to be submitted. When he had being the party of the submitted. When he had being the party of the submitted by the submitte chaled on fuch terms, and by perfilling in his delign accomplished, as we have feen, the deliverance of country. A glorious deliverance it was thince, at the crates informs us, they had put 1400 citizens to death contrary to and without any form of law, and driven 5000 more into banishment; procuring also the death of Alcibiades, as many think, though at a great dillauce from them.

From this time to the reign of Philip of Macedon, the Athenians continued in a pretty prosperous situation, though they never performed any such great exploits as formerly. By that monarch and his fon Alexander all Greece was in effect fubdued; and the history of all the Grecian states from that time becomes much less interesting. Of the history of Athens from that time to the prefent, the following elegant abridgment is gi-

ven by Dr Chandler*. " On the death of Alexander, Attica. the Athenians revolted, but were defeated by Antipater, who garrifoned Munychia. They rebelled again, * Travels but the garrifon and oligarchy were remitated. Deep in Green, metrius the Phalerean, who was made governor, beautified the city, and they erected to him 360 flatnes; Hiffory of which on his expulsion they demolished, except one A hens in the Acropolis. Demetrius Poliorcetes withdrew the from the garrison, and restored the democracy; when they defied time of Ahim, and lodged him in the Opifthodomos or the back the Great part of the Parthenon, as a guest to be entertained by to the pretheir goddess Minerva. Afterwards they decreed, that sent. the Piraus, with Munychia, should be at his disposal; and he took the Museum. They expelled his garrifon, and he was perfuaded by Craterus a philosopher to leave them free. Antigonus Conatas, the next king, maintained a garrison in Athens : but on the death of his fon Demetrius, the people, with the affiftance of Aratus, regained their liberty; and the Piraus, Munychia, Salamie, and Sunium, on paying a fum of money.

" Philip, fon of Demetrius, encamping near the city. defroying and burning the fepulchres and temples in the villages; and laying their territory waste, the Athenians were reduced to folicit protection from the Romans, and to receive a garrifon, which remained until the war with Mithridates king of Pontus, when the tyrant Aristion made them revolt.

"Archelaus the Athenian general, unable to with-Athens be And the Roman fury, relinquished the long walls, and high area retreated into the Pircus and Munychia. Sylla laid taken by siege to the Pireus and to the city, in which Ariftion commanded. He was informed that some persons had been overheard talking in the Ceramicus, and blaming Arition for his neglect of the avenues about the Hep-*achalcos, where the wall was accessible. Sylla resolved to florm there, and about midnight entered the town at the gate called Dypylon or the Pincan; having levelled all abstacles in the way between it and the gate of the Present Arition fled to the Acropolis, but was compelled to suprender by the want of water; when he wa dragged from the temple of Minerva, and put to death holla burned the Piraus and Munychia, and defaced the

and saburbs, not sparing even the sepulchres."

war between Casar and Pompey soon tol
riand their natural love of liberty made them. hate for Coffee conquered. But Casfar did not treat them like Eylla. With that elemency which made so smistile a part of his character, he dismissed them by a fine allulion to their illultrious ancellors, faying, that he spared the living for the take of the dead.

Another form followed foon after this; the wars of Brutus and Callius with Augustus and Antony. Their partiality for liberty did not here forfake them : they took part in the contest with the true patriot Romans, and crected their flatnes near their own ancient deliverers Harmodius and Ariftogiton, who had flain Hipparchus. But they were flill unhappy, for their enemies triumphed.

" They next joined Antony, who gave them Ægina and Cea, with other islands. Augustus was unkind to them; and they revolted four years before he died. Under Tiberius the city was declining, but free, and regarded as an ally of the Romans. The high privi-

_4 O 2

Attica. lege of having a lictor to precede the magistrates was conferred on it by Germanicus: but he was censured as treating with too much condescension a mixture of nations, instead of genuine Athenians, which race was then confidered as extinct.

> "The emperor Vespasian reduced Achaia to a province paying tribute and governed by a proconful. Nerva was more propitious to the Athenians; and Pliny, under Trajan his fuccesfor, exhorts Maximus to he mindful whither he was fent, to rule genuine Greece, a state composed of free cities. You will revere the gods and heroes their founders. You will respect their priftine glory, and even their age. You will honour them for the famous deeds, which are truly, nay for those which are fabiliously, recorded of them. Remember, it is Athens you approach.' This city was now entirely dependent on Rome, and was reduced to fell Delos and the illands in its pollellion.

> " Hadrian, who was at once emperor and an archon of Athens, gave the city laws, compiled from Praco, Solon, and the codes of other legislators, and shiplays, ed his affection for it by unbounded liberality. Attention reflourabed, and its beauty was renewed. Anthonis I'ms who fucceeded, and Antoniaus the entitle tracket

were both benefactors.

" The barbarians of the north, in the reign of Fale." run, belieging Theffalonica, all Greece was actified. and the Athenians reflored their city wall, which had been difmantled by Sylla, and afterwards are glected.

" Under the next emperor, who was the anch Gallienus, Athens was belieged, the archantie offi conted; and the Strategus or general, who had be acted as overfeer of the agora or market, then bosses the supreme magistrate. Under Clauding his fooreffet.

the city was taken, but foon recovered. ..

" It is related, that Configutine, when emperors glound in the title of General of Athens: and relocate of a flatue with an infeription, which he acknowled by a yearly gratuity of many bushels of the conferred on the governor of Attica and Albana title of grand duke, payer dood. That effect annual, but afterwards hereditary. His factories beftowed feveral islands on the city, to find a com.

" In the time of Theodolini, Trade yes Chieft, the Goths laid wafte Cheffelt and Course but Theodore, general of the factories by his product conduct preferved the cities of the factories from pullate and the inhabitants from being led into capturing. Addition of marble was cracked to him at Athens by order of the city; and afterwards one of being the command of the amperor, as appears from an infinitely found in a church do directed to a large of the factories to the factories to a large of the factories to th dicated to a faint of the fagir name, not for from the French convent. It is on a sound pedellah which live ports a flat flame foreign for the holy sable. Endoois the wife of Theodolius Li, was no Athenian.

"The fatal period now approached, and Athens was about to experience a conqueror more lavege even than Sylla. The was Afaric king of the Gothe; who,

under the emperors Accading and Honorius, overran Greece and Italy, facking, pillaging, and deliroying. Then the Reloponnellan towns were overturned, Arcaand Lacedemon were laid walte, the two feas by the ithmus were burnished with the flames of Corinth. Attica. and the Athenian matrons were dragged in chains by harbarians. The invaluable treasures of antiquity, it is related, were removed; the flately and magnificent fiructures converted into piles of ruin; and Athens was thripped of every thing splendid or remarkable. Syncflus, a writer of that age, compares the city to a victim, of which the body had been confumed, and the hide only remained.

" After this event, Athens became an unimportant place, and as obscure as it once had been famous. We read that the cities of Hellas were put into a state of defence by Justinian, who repaired the walls, which at Corinth had been subverted by an earthquake, and at Athens and in Bootia were impaired by age; and here we take a long farewell of this city. A chaim of near 700 years enfurs in its liftory, except that, about the year 1130, it furnished Roger the first king of Sicily with a number of artificers, whom he fettled at Palernio, where they introduced the culture of filk, which thence

with a number of artificers, whom he fettled at Palerno, where they introduced the culture of filk, which thence paliciciants Italy. The worms had been brought from lastices at Constant per in the reign of Justinian.

A content of Justinian.

A content of fraction in the Constant per i A second a second of the secon Venetians landed at the Pirmus, surprised the city, and carried off their plunder and captives to Eubera.

" It is remarkable, thus after thefe events Athenswap again in a manner forgotten. . So lately as about the middle of the 16th century, the city was commonly believed to have been utterly deftroyed, and not to exist, excepts few huts of poor fishermen. Crusas, a learned and inquititive German, procured more authentic information from his Greek correspondents reliding in Turkey, which he published in 1584, to awaken enriofity and to promote farther discoveries. One of these letters is from a native of Nauplia, a town near Argos

of the an-

miana.

Artica. in the Morea. This writer favs that he had been often at Athens, and that it still contained many things worthy to be feen, some of which he enumerates, and then fubjoins: "But why do I dwell on this place? It is as the ficin of an animal which has been long dead."

It now remains to give fome idea of the character, government, and religion of this once fo famous

people. 179 Character

The Athenians, favs Plutarch, are very subject to violent anger; but they are foon pacified. They are cient Athelikewife eafily imprefied with humanity and compation. That this was their temper, is proved by many inflorical examples. We shall produce a few. The fentence of death pronounced against the inhabitants of Mitylenes, and revoked the next day: The condemnation of Spcrates, and that of the ten chiefs, each followed by quick repentance and most pungent grief.

The minds of the same people, adds Plutarely, see not formed for laborious refearches. They feine a fubnot formed for laborious relearches. They feize a fubject, as it were by intuition; they have not patients and phlegm enough to examine it gradually and interprint and interprint and interprint and interedible. At the first character and for their rank, are in patients from the Aspendix and the first character and properties of the first character and the first characte

programs.

Are observed implementations are all the process of the served in thes

but the Short with what phages and Demarktunes applied their miles the phages and Demarktunes applied their miles the remy to the Atherica paught. When the popular enjoyed peace, lays the lane Plutarish in an place, is encouraged the adulation of its orange and when it had important affairs to differ to when the fate was in danger, is became forious; and preferred to its cloquent sycophants, the honest orature who opposed its follies and its vices; such ingomous and buld patriots as a Pericles, a Phueion, and a Demos theacs.

The Athenians, continues Plutarch, often make their governors tremble, and how great humanity to their enemies. They were very attentive to the information and instruction of those citizens who were most emisent for their policy and eloquence; but they were on their guard against the Superiority of their talents;

they often checked their holdness, and repressed their Australia exuberant reputation and glory. That this was their temper, we are convinced by the offracism: which was chablished to restrain the ambition of those who had great talents and influence, and which ipared neither the greatest nor the best men. The detectation of tyranny and of tyrants, which was inherent in the Athenians, rendered them extremely jealous of their privileges, made them zealous and active in defence of their liberty, whenever they thought it was violated by men in power.

As to their enemies, they did not treat them with rigour. They did not abuse victory by a brutal inha manity to the vanquished. The act of amnelly, which they passed water the insurpation of the 30 tyrants. proves that they could cally furgive injuries. It was this middle last this humanity of disposition, which made the Arienism for attentive to the rules of politenels and decomme In their war with Philip, having feizbisse of his couriers, they read all the letters he bisse of his couriers, they read all the letters he bisse of his four Olympias to her huiband, which they hack unopened. Such was their versions of his and conjugal feorecy; those facred anglish which the enmity, no holdlity, warrants us to notific.

The receive of conquest cherished by a small republic, were ententive and aftonishing; but this people, to great, to ambitious in their projects, were, in other stouts, of a different character. In the expenses of the sable, in drefs, in furniture, in houses, in thou, in public, indes, they were frugal, fimple, modelt, poor; and magnificent whenever the hopline of the flate was concerned. Their conquefts, their riches, their riches, their connexions with Minor, never reduced them to Many, to riot, to pomp, to profusion. Kenophon semucks, that a citizen was not definguished from a the him drefs. The wealthieft citizen, the most

the hy his dreis. The weatment crizen, the more residenced to go himself to the Athenians, for all the arts and full known. When they had delivered their the tyranny of Pisitratus, and after this had a the vast efforts of the Persaus, they may have the further of their national glory. the tast the funding of their national glory. the fivereignty of Greece; and the sale of the sa they faw the chant decenter.

Human affaire art by nature, prone to change; and tlates, as well as individuals, are born to decay. Pealoufy: and ambition infentibly formented wars, and fuccels in thele wars, as in others, was often various. The military firength of the Athenians was first impaired by the Lacedemonians; after that, it was again :

humiliated !

Airica, humiliated, under Epaminondas, by the Thebans: and last of all it was wholly crushed by the Macedo-

mian, Philip.

Nor, when their political fovereignty was loft, did their love of literature and arts fink along with it. Just at the close of their golden days of empire flourished Xenophon and Plato, the disciples of Socrates, and from Plato descended that race of philosophers called the Old Academy. Aristotle who was Plato's disciple, may be faid, not to have invented a new philosophy, but rather to have tempered the sublime and "rapturous mysteries of his master with method, order, and a stricter mode of reasoning. Zeno, who was himself also educated in the principles of Platonism, only differed from Plato in the comparative estimate of things, allowing nothing to be intrinsically good but virtue, nothing intrinsically had but vice, and con-. fidering all other things to be in themselves indifferent. He too and Aristotle accurately cultivated logic, but m different ways; for Aristotle chiefly dwelt upon the simple syllogism; Zeno upon that which is derived out of it, the compound or hypothetic. Both too, as well as other philosophers, cultivated rhetoric with logic; holding a knowledge in both to be south fite for those who think of addressing manking all the efficacy of perfuation. Zeno elegantly intition ed the force of these two powers by a finise; taken from the hand: the close power of logic he compared to the fift, or hand comprett; the diffuse power of rhetoric, to the palm, or hand open.

The new academy was founded by Arcefiles, and ably maintained by Carneades. From a midialical line tation of the great parent of philosophy Societies for ticularly as he appears in the dialogues of Plates, the cause Socrates doubted some things, therefore the cause of the fila, and Carneades doubted all. - Epicurus drew from another fource; Democritus had taught him atoms and a void : by the fortuitous concourse of stoms be cied he could form a world; while by a feigned we ration he complimented away his god; and turning their providential care, left the troops impair their uninterrupted state of bliss. The commended, though not for the false of pleasure: pleasure, according to him being and fovereign good. See Autroops. PLATO, SOCRATES, &c.

We have already meneiosed in allament philotophy and rhetoric. This wonderful, if rhetoric be the analysis in the content of t wonderful, if rhetoric be the analytical with the funded, and if men cannot be with the state of the abled Greek philosopheri paragraph of the state in compositions as clumly as the common dialect of the mere vulgar.

The same love of elegance, which made them atand to their ftyle, made them attend even to the plawhere their philosophy was taught. Plato delied his lectures in a place shaded with groves, on the

banks of the river Ilissus; and which, as it once be- Attica. longed to a perion called Academus, was called after his name, the Academy. Aristotle chose another spot of a fimilar character, where there were trees and shade: a spot called the Lycrum. Zeno taught in a portico or colonade, diffinguished from other buildings of that fort (of which the Athenians had many) by the name of the Variegated Partico, the walls being dedorated with various paintings of Polygnotus and Myro, two capital malters of that transcendent period. Epicurus addressed his hearers in those well known gardens, called after his own name, The gardens of Epicurus.

These places of public inflitution were called among the Greeks by the name of Gymnasia; in which, whatever that word might have originally meant, were taught all those exercises, and all those arts, which tended to cultivate not only the body but the mind. As man was a being confilting of both, the Greeks could not consider that education as complete, in which both were not regarded, and both properly formed. Times their Cymnasia, with reference to this double

Hence their Gymnaia, with reference to this double their adorsed with two flatues, those of Mercury trains adorsed with two flatues, those of Mercury trains also the cooperate accomplishments being for interest to the god of firength, an arms of the cooperate accomplishment accomplishment with a character of the cooperate accomplishment was fall and as a few parts of the second secon

some of the state of the companies of the state of the st their government. From the beginning of the Perhen war, they incrinced every thing to the liberty of Greece. They left, without helitation, their cities, their houses, to fight at sea the common enemy, from whom they were in danger of fervitude. What a glorious day was it for Athens, when all her allies growing inflexible to the advantageous offers which were made to them by the king of Perlia, the replied by Aristides, to the ambassadors of that monarch, -" That it was impossible for all the gold in the world to tempt the republic of Athens: to prevail with her to fell her liberty, and that of Greece. It was by their generous fentiments

Artica feutiments that the Athenians not only became the bulwark of Greece, but likewife guarded the reft of Europe from a Perlian invalion.

> Thefe great qualities were blended with great failings, feemingly incompatible with patriotilm. For the Athenians, notwithflanding their tenacious jealoufy of the rights of their country, were a volatile, inconstant, capricious people.

Religion.

wie's fe rity.

There never was a people more attentive to the worthip of the gods than the Athenians. The worthing of their principal deities was diffuled over all Greece, and even beyond its limits.

Each temple had its particular religious rites: the pomp, the ceremonies, the duration, and the fuccefnon of the folemn feafts, were all appointed by fixed rules. The worthip paid to each divinity, whether public or private, was founded on traditions, or on laws conflantly ob yed. The feath of Bacchus, the Panathenea, the feath of the mysteries of Eleusia, were to lebrated according to established rules, small of minimum were as ancient as the feath themselves, small of minimum were as ancient as the feath themselves, small of the conflated on a state were consulted on a state were consulted on a state word deity was interest. We are consulted in the themselves and the month is a state of the conflate of the control of the state of School, was to state of the ample, and to the law of School, was to state of the confiantly obeyed. The feast of Baccines, the Panaregulations to the few of Solits when the fenate to repair to the few of Solits when the feast to treat the feast to repair to file the feast to the second with the feast to the fea

than those which had been chabished by the the flate, and practifed by their country from time memorial. They were only folicitous to preferre worship, which was closely interwoven with their go vernment, and made a part of its policy. They were likewife attentive to the ceremonial pomp; because order, the regular vigour of legislation, depends greatly on the awe impressed by externals. But as to the inconfiftent and monftrous comance of fables, foreign opimons, popular traditions, and portical fictions, which formed a religion quite different from that of the flate -in it they were very little interested, and allowed every one to think of it as he pleafed.

This explanation will reconcile a feeming contradiction in the conduct of the Athenians, who gave great license to their poets, and severely punished the ci- Atticase tizens who were guilty of impiety. Aristophanes, who made as free with the gods as with the great, was applauded by the Athenians. They condemned Socrates to death, who revered the dairy, but disapproved the public manner of worthipping him. The life of Æscholus was in danger from a suspicion that he had revealed fome of the fecrets of Elcufis in one of his pieces. The wit of Arittophanes's diama was unpunithed.

The priests were not confined to the care of the al-Puch. tars; there who were vested with the saccidotal digni-their dutys ty, which was only incompatible with professions merely useful and lucrative, might likewise hold the most important offices of the commonwealth. This we could prove by a great number of examples; we shall cite that of Kenophon the illustrious historian and philosopher; he was likewife a famous general, and he was a print. He was performing the facerdotal function

when he received the news of his fon's death, who was the battle of Mantinea.

The least ministry was not only compatible with the profession of arms.

It is the foldier were often blended. Calling the foldier were often blended. This cutoff Ceres, fought at Platæa. This cutoff peculiar to the Athenians. The Later the battle which we have int nonconsiderater the battle which we have just mentioned, made three graves for their flain; one for the

riefly one for the other Spartans, and one for the the revenue hard temes, the priefts had a revenue hard temes, to We know that a part of the victims right; and that apartments were affigued than many the temples. But, believe these advantages, fire had a lalary proportioned to the dignity of their line and to the rank of the detries whom they like it falary was probably paid from the inof the temples. Those revenues, which kept the ind defrayed the facrificial expense, the idea like. They were of many differences

risk the facred revenus arofe from fin the continuous were condemned to pay for various for which the tenth part was appropriately Polias, and the fiftieth to the other ces whose names their tribes bore.

The did not hold the assembles did not hold the assembles as they were obliged to pay the confice it was to lay before the waste office it was to lay before the confice it was to lay before that duty according to the continuous that duty according to the last that duty according to the last of Markows has incorrer, was applied to the last of Markows has incorrer, was applied to the last of Markows has incorrer, was applied to the last of Markows has incorrer, was applied to the last of Markows has incorrer, was applied to the last of Markows has incorrer, was applied to the last of Markows has incorrer, was applied to the last of Markows has incorrer, was applied to the last of Markows has incorrect which was the common pro-

Bendes this revenue, which was the common property of the gods, and which varied according to the number and degrees of the mildemeanors, the temples had their permanent revenues: We mean the produce of the lands which were confecrated to the deities. We do not here allude to the lands confectated to the gods, which were never to be cultivated; fuch as the territory of Circha, profesiled by a falemn decree of

Artica the Amphiciyons; the land betwixt Megara and Attica, which was confecrated to the goddeffes of Eleuhis, and many others. We would fpeak only of those which were cultivated, the fruits of which curiched the

> There were likewife lands belonging to the flate, the produce of which was destined to defray the expence of the facrifices which were offered in the name of the republic. There were likewife first-fruits which the public officers levied on all lands, for the use of the gods. All these emoluments made a part of the revenue of the

The gods, befides the revenues immediately appertaining to their temples, had certain rights which were granted them by particular compact. The Lepreatz, for inflance, were obliged to pay every year a talent to Olympian Jupiter, on account of a treaty of alliance which they made with the Eleans in one of their wars. The inhabitants of Epidaurus, to obtain leave from the Athenians to cut down olive trees for flatnes, which the Pythian priestels had commanded them to make, engaged to fend deputies every year to Athens, to offer facrifices in their name to Minerva and to Neptune. But this prerogative was rather honorary, than

The tenth part of the spoils taken in war was likewife the property of Minerva. Sacred welfels were bought with the effects of the 30 tyrants. In short, the gods were profited by almost every public accident. But what contributed most to enrich the famous temples of Greece, was the money which was conftantly brought to them by individuals, in confequence of vows they had made, or to pay for facrifices which were offered in their names. The credulity of the people was an inexhaultible fund. That credulity enriched the temples of Delos and Eleufis, and fupported the magnificence of Delphi. And those immense treasures which were the fruit of superstition, were often a prey to

These revenues were not deposited with the prices; nor did they expend them. A moderate lalary was all their gain; and to offer facrifices to the deities whole ministers they were, was all their employments

It is very probable that all the facred revenues wife paid into the hands of officers who were apparent to receive them, and who were to give an abcount of the discharge of their trust. Nay, we cannot doubte this, after reading a passage in Arthorie, who, speaking of the officers of the temples, expressly mentions those who were intrusted with the most apperiance to the gods. Citizens, without doubt, of appropriation integrity, were chosen to this office; and their dies muil have been, to keep the temples in sepale and der, and to disburfe and keep an account of the nary facred expenses.

As to the foleran fields, which were includibly magnificent, fuch as the fewst of Bucchas, and the Panathomas, the were belebrated at the expense of the Choryus; of the chief of the choir of each tribe: for each ribe had its poet and its mulicians, who fung, crantating each other, hymns in honour of the deity. The richell citizens were appointed chiefs of the difand as their office was very expensive, the hademuify them in some degree, the Choregus of The victorious tribe had the privilege of engraving his name on the tripod which that tribe fullpended to the Attiget roof of the temple. This office, though ruinous, was eagerly folicited; and naturally, in a republican flate. It led to honours, like the curale dignity at Rome; and it greatly tended to ingratiate its polleffor with a people who were more affected with pleafures than with effential fervices, and who, confequently, would more highly efterm a profuse Choregus than a victorious general.

With regard to the fines, which were, in the whole or in part, the property of Minerva and of the other deities, there were at Athens public treasurers appointed to receive them. They were ten in number, and they were nominated by lot. They were called Treasurers of the goddess, or Receivers of the facred money. That money they received in the presence of the fenate; and they were empowered to diminish or to annihilate the fine, if they thought it unjust. The slatue of Minerva, that of the victories, and the other invaluable pladges of the duration of the flate, were depoliced with them.

which treaturg in which the money confecrated to the chinerys Polizes and from its fituation it was termed Opifudomus. At was furnished with a double wall. It had but one door, the key of which was kept by the Epistates, or chief of the Prytones: his dignity was very confiderable; but it latted only one day. In this treafury a register was kept, in which were written the names of all those who were indebted to the flote : he who owed the imallest one was not omitted. If the debtors proved infolvent, they were profecuted with extreme rigous, and often punished with a caustry which gods was the entire, or cather the pretext. The facted traduces held the state the pretext. Of the facted traduces held the state the pretext among the magnifester, who received the profile features. Of these magnifesters were many final of enterpoint.

Whe telusared posses did upor compole an order di-And and loperate from the other anders of the flates They did not form a body muted by particular laws. page (the November of Cores, and of Protocolor, and many many chief whose authority extended to all his influence. The dignity of fovereign gentiff was anxiously of Arbeits; and saels of the problem of the problem. The resident anxiously of the principal desiders there of Miscolor, and the principal desiders there of Miscolor, and many ministers; and in each of the n chief prefided. who had the state of High Prick. The number of fubthere mailters was in proportion to the rank of the deligns but the priests of one temple were alregather a figurate fociety from those of another. Thus at Athem there was a great number of high priefts, bea cause many deities were worthipped there, whose fervice required many ministers. The power of each priest was confined to his temple; and there was no fuvereign pontiff, the minister general of the gods, and the president at all the reads.

It naturally follows from this account, that the minifters of the gods at Athens were not judges in matters They were neither authorized to take of religion. cognizance of crimes committed against the deity, nor to punish them. Their function was to offer facrifices to the gods, and to entreat their acceptance of the

adorations

Attica adorations of the people. But the punishment of implety, of lacrilege, of the profanation of mysteries, and of other meligious crime, was not intrufted to then zeil

The priests were not only incapable of avenging crimes against religion by a temporal process, they even could not, without an express order either from the fenate or the people, exercise their right of devoting criminals to the inferrid gods. It was in confequence of a civil fentence pronounced against Alcibrides, that the I uniolpide launched their anothema against him. It was in virtue of another decree that they revoked their imprecitions, when his countrymen wanted his fervice, and the efore reflored him to their favour

Religious causes, according to M. de Bougainville, fell under the juridiction of the Hehafta.

The government, though often altered, continued pretty much on the plan established by Solon.

People dilifterent

The people of Athens were freemen, logourners, or flaves. The citizens, called in Greek Polital, were yeary ribes, &c in the time of Cecrops as in the most flourishing of the commonwealth, hardly ever experience account.

It was Solon that decreed the orac the last he serious ted free but fuch as were Atlenians bush by father and mother. After his time it fell into destretude, till revived by Péricles, and again at his infrance repealed. After the expulsion of the 30 tyrants, Solon's law was restored. A person born of a stranger was styled Nuther, a haltard; whereas the fon of a free woman was called Chefios, 1. c. legitimate. These was in Cynolarges a court of judicature, to which travies of illegitimacy properly belonged; and the utmoft care was taken to properly beinged, and the third active of the properly beinged, and the third properly who had not a clear tributality the third were divided by Cocrops into the tributant of the first called Cocropes, from Cocrops, distributed to the first called another king of Atlent, or rather from the white fignifies a fhore; the fourth, Parales. These sames were altered by Cransus, and again by Ericthonius. the reign of Erectheus, they were again changed;" a foldiers were called Oblital, the craftimen Ergales, the farmers Georges, the graziers and frepherds Agricorage in this flate they were when Solon fettled the commun wealth, and appointed the Laste to be compiled in number of the tribes to 10; and made the fante could of 500, taking 50 out of each tribe. In fueresting times, two other tribes were added. Each tribe were Subdivided into its Dimos or wards; and with refpett to these it was that Solon instituted the public feests before mentioned, at which fometimes the whole tribe affembled, fometimes feveral wards, and fometimes only the inhabitant of one ward

The fecond fort of inhabitants we mentioned were called Meinen, i. e. for urmers, th fe were perfons who lived always at Athen, yet were not admitt d free denizers, as for fuch is cid not conflaitly relide in Ath no, they were filled Int, I c firangers The fojourners were of liged to choose out of the citi zens protector, who were flyked Patr ns they pul fervices to the flate, and bet de thefe a rant und tod ute of 12 dirichms for every min, and fix for every wo-Vol. II. Put II.

man; but fuch as had fons, and paid for them, were Atticaexempted. If people fell to poverty, and were not able to pay the tribute, they were ferzed by the tixmatters, and actually fold for fl ves; which, as I)10genes Lacitius tells us, was the fate of X nocrates the philosopher The sojourners in Attica were under the fime law as those in Athens. As to servints, they were freehen, who through indigency were driven to receive wages, and while they were in this flate had no vote in the affembly As to flives, they were abf lutely the property of their mafters, and as such were used as they thought fit . They were forbidden to war clothes, or to cut their han, like their mafters, and which is indeed amazing, Solon prohibited them to love boys, as if that had been honourable. They were likewife debarred from anointing or perfuning them felves, and from worthipping certain deities. Th y were not allowed to be called by honourable names, and in most other respects were used like dogs. They stigmatized them at their pleasure, that is, bi in led them with letters in the forehead and eliewhere. However, Thefeus's temple was allowed them as a ranctum, whither, if they were exceedingly ill used, they might fly, and thereby oblige their owners to let them 1 transferred to another mafter. In this and many oth i respects the Athenian flaves were in a much better co dition then those throughout the rest of G ecce there were permitted to get efficies for themselves, giving a fmall premium to their mafters, who were obli, d to make them free if they could pay their rantom, they likewife obtained the same favour from the kindness of their mafters, or for having rendered military fervices to the flate. When they were make free, they were obliged to choose patrons, and had likewise the privilege of choosing a curator, who, in cale their pations injured them, was bound to defend them

The general affembly of the people, which Solon (made the dernier refort, was called the Ichin, as 11 consisted of all the freemen of Athens, expine such the I is were attend or infamous. The meetings of these of Comblets were either ordinary or extraordinary prolingly were fuch as were appointed by law, the c transfinary fuch as needlity required. Of the fil there were four in 35 days. In the first aft : ly the emproved or rejected magificates, hear I petals sublice good, and certain caufe. In the feend exercises petitions, and hand every min' put ement on the markers that were before there. In the third they gave audience to foreign ambifinders. It fourth was employed altogether in all its relation to the gods and their worthip. The extra dinity rece angs were appointed by the magnificates who noce it in required, whereas to the ordinary iff inl'es the perple came of their own accord. The fait witch livether in the market-place, in the Park ight citadel, or in the theatre of Bacching is to the the magnifrates who appoint d he extraction as a coing appointed also the place where they short l' 1 ld. If any fudden tempest sole, or a yearhquile herpen c, er any figu notorioully in utp on a cuel, the affer bly wa immedatory a joined, topic the p ople from apprels idin uthappy content from this delleration. Bit if the vention of in mid feren , and nothing happe added of the order of tife of the ge, they proceeded to purity the place where

the affembly was held, which was done by fprinkling it round with the blood of young pigs; then the crier made a folemn prayer for the prosperity of the republic, and that heaven would bestow a happy issue on their counfels and undertakings : he then pronounced a bitter execration against any who should in that assembly propound what might be disadvantageous to the state. These ceremonies being over, they proceeded to busi-

186 Method of

There were several magistrates who had the oversecgiving their ing and regulating these assemblies. These were, first, the Epistate, or president of the assembly, who was chosen by lot out of the Proedri : his office was to give the fignal for the people's voting. Next to him were the Prytanes, i. e. a committee of the senate, who of course were present on this occasion: by their order a programma, or scheme of the business to be proposed at the affembly, was previously fet up in some public place, that every man might know what business to apply his thoughts to. The Proedri were nine in number, appointed by lots out of all the tribes to which the Prytanes did not belong: they had the right of propoling to the people what they were to deliberate spon, and their office ended with the affembly; there fat with them affellors, who were to take care that nothing they proposed was detrimental to the commonwealth; inft step to business was the crier's reading the decree of the scnate whereon the assembly was to deliberate; when he had finished this, he made proclamation in these words: Who of the men above 50 will make an oration? When the old men had done speaking, the oner made proclamation again that any Athenian aught then offer his fentiments, whom the law allowed fo to do; that is, all fuch as were above 30 years old, and were not infamous. If fuch a one role up to fpeak, the Prytanes interposed, and bid him be filent; and if he did not obey them, the lictors pulled him down by force. When the debates were over, the prefident permitted the people to vote; which they did by caffing full beans, but in aftertimes pebbles, into certain wellfels : thefe were counted, and then it was declared that the decree of the senate was either rejected or approved: after which, the Prytanes difmiffed the affembly.

187 The fenute.

The fenate was inflituted by Solon to prevent the dangerous confequences of leaving the supreme poter in the people. At the time of his inflitution, it confist of 400, 100 out of each tribe; it was incut to 500, when the tribes were augmented to so; and when they came to 12, it was also swelled to 600, They were elected by lots after this manner: At a day appointed, towards the close of the year, the prefident of each tribe gave in a lift of fuch persons belonging thereto, as were fit for and defired to appear for this dignity; these names were engraven on tables of brass, and a number of beans equal to the number of the amount of them, among which were 100 white ones, put into a veffel; and then the names of the candidates and the beans were drawn one by one, and such as were drawn by the white beans were received into the fenate. After the senate was elected, they proceeded to appoint the officers who were to prefide in the fenate: these were the Prytanes before-mentioned; and they were elected thus: The names of the ten tribes were thrown into one wellel, and nine black beans and a hise one into another vellel. Then the names of the

tribes were drawn with the beans. The tribe to which Attics. the white bean answered, presided first; and the rest according to the order in which they were drawn.

The Prytanes, while the senate consisted of 500, Prytanes. were 50 in number. For the farther avoiding of confusion, therefore, to of these presided a week, during which space they were called Proedri; and out of these an Epitlate or prefident was chosen, whose office lasted but one day, and by law no man could hold it more than once: the reason of this was, that he had in his custody the public feal, the keys of the citadel, and the charge of the exchequer. The reader muit distinguish between the Epistates and Proedri last mentioned, and those spoken of in the former paragraph, because, though their titles were the same, their offices were perfectly diffinct. The fenate assembled by direction of the Psytanes once every day, excepting fethivals, and fometimes oftener, in the tenate house, which was thence called Prytaneum.

. When a member of the lenate made a motion for a Lawshow new law, it was immediately engraven on tablets, that established, the members when they came next might be prepared &c.

At the subfequent assembly the Epi
trapeace are matter; after which every senator that
because delivered his semigrapus; then any of the Pry
tance drew the decree, and repeated it aloud: after which they proceeded to vote; and if there was a majority of white beans, then it became pleasing, and was afterwards propounded to the people : if they approved it, it became a law; otherwife it was of no force longer than the fenate who decreed it sublifted. The power of the senate was very great; for they took the account of magistrates at the expiration of their offices; they directed the provisions made for poor citizens out of the public treasure; they had the inperintendency of public religions, and in the public public functions of public religions. The public public function is an interpretable of the fleet; and public all their descriptions of automaty, and it was a public for us to mention. Philose thay took their feats, they were constrained to undergo a very first examination, wherein the whole somic of their lives was inquired into a and if the host the on their reputation appeared, they were he stille. When this examination was given, they took as pitch, whereby they bound themselves to promote in all their examines the public good, to adults mathing contrast to the laws, and to execute their functions exactly. highest the leaste could impole was 500 drachins : if they thought the offender deserved a heavier mulch. they then transmitted the cause to the Thesmothetes, who punished him as they thought fit. The senstors. when their year was out, gave an account of their manegement to the people: but that they might have the less to do, they always punished such of their number as they found had offended by expulsion; and in this they were mighty exact. Yet an expelled fenator was notwithstanding eligible to any other office, the most trivial omission being sufficient to occasion a dismission from the fenatorial dignity; and therefore, when the tribes chose their senators, they also chose a certain. number of sublidiaries, out of which, when a fenator was expelled, another was substituted in his place. Each fenator was allowed a drachin every day: for it was a constant rule with the Athenians, that the public

Amica. ought to pay for every man's time; and therefore such of the poor Athenians as thought fit to demand it, had three oboli for going to the affembly. If during their administration any ships of war were built, the senators had crowns decreed them; but if not, they were forbid to fue for them.

Next to the senate was the court of AREOPAGUE;

for a description of which see that article. The chief magistrates of Athens were Archons, and inferior to them there were many others; of whom it will be necessary to mention some. In the first place, they had Nomophylaces, who were also styled the eleven, because they were so many in number, one chosen out of each tribe, and a clerk or fecretary who made up the eleventh. Their duty it was to look to the execution of the laws; they had authority to feize robbers and other capital offenders; and if they confessed, to put them to death. Dr Potter thinks they refembled our The Phylarchi were the presidents of the Athenian tribes; but in time this became amilitary title. The Philobofileus was an officer in each tribe, who did the same things within his jurisdiction to the Bast did with respect to the state. The Demarch is a principal magistrates in words. The Legarchist is in number, and were books to take the share the pieces and were books to take the share respectively to the assembles as in their custody was the public register of the circles names. They had under their laxous, who were listors or bassiss, they were formetimes 1000 in number ; their men were negeffary 1 but, like thost of their fart, were in a magner to famous, as may be gathered from the comedies of Ariftophanes; they were generally flepthians, raw boned, brawny fellows, ready to executed any thing they were commanded. The Nomathers were 1000 in number ; their business war to work over and inspect into the laws. There were two latters to the first. Some weight at pastors in the service of the first. Some weight at pastors in the service to severe, that they did not permit the on shore, but obliged him to please the from the fart. In the service weight and their pastors are the service of the winds and seas. being elected twice. These the service weight as the servi led drators railed seasons, exceed a soft, meaning in the lengte busine. For the they had their drated fees; and south setpession their charles as the fees; and south setpession their charles are the law run that it become the south of their feest his percent, demand their manners, or that steem out of his days, who had before the feest attack to be set the season way his finish a not season, notoriously effectionate, or this city was the percentage. If any man who has been guilty of thele dringer date to deliver an oration, let him be brought to trial apon The fpot. Let an orator have children tawfully begotten, and an estate within Attica; if in hie orution the talks impertinently, makes idle repetitions, affects an unbecoming raillery, digresses from the point in question, or, after the assembly is over, abuses the prefident, let the Proedri fine him 50 drachms; and if that is not thought enough, let him be brought before the next affembly and fined again."

We shall conclude this draught of the Athenian government with an account of their courts of justice, which, exclusive of the Arcopagus, were 10 in number; four had cognizance of criminal, and fix of civil causes. These 10 courts were numbered with the 10 first letters of the alphabet, and were thence styled,

Alpha, Beta, Gamma, &c. When an Athenian was Attita. at leifure to hear causes, he wrote his own name, that of his father, and the ward to which he belonged, upon a tablet; this he presented to the Thesmothetæ, who returned it again to him with another tablet, with the letter which fell to his lot; then he went to the crier of the court, who prefented him a fceptre, and gave When the causes were over, every him admission. judge went and delivered his fceptre to the Prytanes. and received a stated fee for every cause that was tried. But as this was intended only to compensate their loss of time, to that there might be no appearance of covetoulnels, a man was forbid to fit in two courts on the The first criminal court after the Areopagus, was that of the Epheia. It confisted of cr members, all upwards of 51 years old. Draco gave it a very extensive jurisdiction; but Solon took away from them the power of judging in any other causes than those of manslaughter, accidental killing, and lying in wait to deftroy : the Basileus entered all causes in this court. The fecond criminal court was called Delphiniam, because it was held in the temple of Apollo Delphinips, it had cognizance of fuch murders as were confessed by the criminal, but at the fame time juffi-fied under some pretence or other. The Prytansum was the third criminal court. It held plea of fuch cases where death cufued from inanimate things: causes were heard here with the same solemnity as in other courts; and on judgment given, the thing, whatever it was, that had occasioned the death of a man, was thrown out of the territory of Athens. The last criminal court was flyled Phreatum. It fat in a place not far from the isa fhore; and fuch persons were brought before this societ as had committed murders in their own country and fled to Atties; the proceedings of this court were to severe, that they did not permit the criminal to come on fhore, but obliged him to plead his cause in his meffel; and if he was found guilty, he was committed

Of the judicatures for hearing civil canfes, the first wee the Paraballon, so called, as some think, because in it no matter could be heard if the cause of action The Canon, or new court, the second tribunal. The third was flyled the court, because it assembled in a temple dedinated for the court, whose statue, represented with the court, was set up in all courts of justice. The was triangular in its Me court Maidlus derived its appellation from the state of the built it. The fixth and last court was by far the greatest, and is renerally chareised to have derived its name from the judges litting in the open air exposed to the fun. All the Athenians who were free citizens were allowed by law to fit in these courts as judges; but before they took their feats were Iworn by Apollo Patrius, Ceres, and Jupiter the king, that they would decide all things -rightcoully and according to law, where there was any law to guide them; and by the rules of natural equity, where there was none. The Helzastic court confisted at least of 50, but its usual number was 500, judges; when causes of very great consequence were to be tried, 1000 fat therein; and now and then the judges were increased to 1500, and even to 2000. There were many inferior courts in Athens for the decision of triAtticue, vial causes; but of these there is no necessity of speak-Attila. ing, fince we defign no more than a fuccinct view of the Athenian republic, as it was fettled by and in confequence of Solon's laws.

> ATTICUS (Titus Pomponius), one of the most hosourable men of ancient Rome. He understood the art of managing himfelf with fuch address, that without leaving his flate of neutrality, he preferved the effects and affection of all parties. His strict friendship with Cicero did not hinder him from having great intimizer with Hortenfius. The contests at Rome betwo in Cipna's party and that of Marius induced him to go to Athene, where he continued for a long time. He was very fond of polite learning, and kept at his house several librarians and readers. He might have obtained the most considerable posts in the government; but chole rather not to meddle, because in the corruptron and faction which then prevailed he could not difcharge them according to the laws. He wrote Annals. H. married his daughter to Agrippa; and attained to the age of 77

> ATTILA, king of the Huns, furnamed the feourge of God, level in the 5th century. He may be ranked amough the greatest conquerors, fince there was fearesly any province in Europe which did not feel the weight of his victorious arms.

V in. P- 357.

C 13 11's

Atula deduced his noble, perhaps his regal, defeent, from the ancient Huns, who had formerly contended with the monarchs of China. His features, according to the observation of a Gothic historian, bore the stamp of his national origin; and the portrait of Attila exhibited the genuine deformity of a modern Calmuck; a large head, a fwarthy complexion, fmall deep-feated eyes, a flat nofe, a flew hairs in the place of a beard, broad shoulders, and a short square body, of nervous strength, though of a disproportioned form. The haughty step and demeanour of the king of the Huns expressed the consciousness of his superiority. above the relt of mankind; and he had a custom at fi reely rolling his eyes, as if he wished to enjoy the terror which he inspired. Yet this favage here was not inaccessible to pity; his suppliant chemies mightin confide in the affirance of peace or pardon; and Astila was confidered by his subjects as a just and india gent matter. He delighted in war : but; wire be afcended the throne in a mature age, his head, than his hand, achieved the conquest, of the same and the fame of an adventurous foldier was usefully and changed for that of a prudent and successful general. The effects of personal valour are to incomiderable except in poetry or romance, that victory, even among barbarians, must depend on the degree of skill with which the passions of the multitude are combined and guided for the fervice of a fingle man. The arts of Attila were skilfully adapted to the character of his age and country. It was natural enough, that the Scythiaus should adore, with peculiar devotion, the god of war; but as they were incapable, of forming either an abitract idea, or a corporeal representation, they worshipped their tutelar deity under the symbol of an iron scimitar. One of the shepherds of the Huns perceived, that a heifer, who was grazing, had wounded herfelf in the foot; and curiously followed the track of the blood, the discovered, among the long grass, the point of an ancient fword; which he dug out of the ground,

and prefented to Attila. That magnanimous, or ra- Attila. ther that artful, prince, accepted with pious gratitude this celefial favour; and, as the rightful possesfor of the fword of Mars, afferted his divine and indefeasible claim to the dominion of the carth. If the rites of Scythia were practifed on this folemn occasion, a lofty altar, or rather pile of faggots, 300 yards in length and in breadth, was raifed in a spacious plain; and the fword of Mars was placed erect on the fummit of this ruftic altar, which was annually conferrated by the blood of fleep, horses, and of the hundredth captive. Whether human facrifices formed any part of the worship of Attila, or whether he propitiated the god of war with the victims which he continually offered in the field of battle, the favourite of Mais foon acquired a facred character, which rendered his conquelts more easy and more permanent; and the barbarian princes confessed, in the language of devotion or flattery, that they could not prefume to gaze with a steady eye on the divine majesty of the king of the Huna. His brother Bleda, who reigned over a considerwhile part of the nation, was compelled to refign his far the and his life, : Yet even this cruel act was attributed to refund the repulse; and the vigour with which Attlibutelded the farmed of Mars, convinced the world that it had been referred alone for his juvincible arm. But the extent of his empire affords the only remaining evidence of the number and importance of his victories; and the Scythian monarch, however ignorant of the value of fcience and philosophy, might perhaps lament that his illiterate subjects were destitute of the art which could perpetuate the memory of his exploits.

If a line of feparation were drawn between the civilized and the favage climates of the globe; between the inhabitaous of cities who additioned the earth and the hunters and the favage with the same and fole monarch of the Barbarians. The large same and fole monarch of the Barbarians. The large same the two mighty had been and folermany and save in a same those vague. In the confidence of Germany and Savetha; and those vague applications, when they are applied to his reign; many and savethard and nich an according betterde. be underkood with an extensive latitude. Theringia, which Restched beyond its advant limits at far as the Dauble, was in the number of his provinces; it is a corpoled with the weight of a powerful neighbor, in the domestic affine of the Franks; and one of his near tenants the fifth and almost externinated, the Burgundians of the Rhine. He subdued the islands of the ocean, the kingdoms of Scandinavia, encompassed and: divided by the waters of the Baltic; and the Huns might derive a tribute of furs from that northern region, which has been protected from all other conquerors by the severity of the climate, and the courage of the na-Towards the east, it is difficult to circumfcribe the dominion of Attila over the Scythian deferts : yet we may be alfured, that he reigned on the banks of the Volga; that the king of the Huns was dieaded, not only as a warrior, but as a magician; that he infulted and vanquished the khan of the formidable Geougen; and that he fent ambassadors to negotiate an equal alliance with the empire of China. In the proud review of the nations who acknowledged the fovereignty of Attila, and who never entertained during his lifetime the thoughts of a revolt, the Genda and the Offrogothe

Attire Attorney. were diflinguished by their numbers, their bravery, and the personal merit of their chiefs. The renowned Ardaric king of the Gepidæ, was the faithful and fagacious counfellor of the monarch; who esteemed his intrepid genius, whill he loved the mild and difereet virtues of the noble Walamir king of the Offrogoths. The crowd of vulgar kings, the leaders of to many martial tribes, who ferved under the standard of Attila, were ranged in the submissive order of guards and domestics round the person of their master. They watched his nod; they trembled at his frown; and at the first figual of his will, they executed without murmur or hefitation his flern and absolute commands. In time of peace, the dependent princes, with their national troops, attended the royal camp in regular fucceffion; but when Attila collected his military force, he was able to bring into the field an army of five, or, according to another account, of feven hundred thoufand Barbarians.

For an account of his exploits and death, fee the article Huns.

ATTIRE, in hunting, fignifies the head or had a deer. The attire of a flag, if period, considering pearls, beam, gutters, antier by antiferiors, forwanter, advancer, paim, and fpeliers.

ATTORNEY at the angles with Societies
or Proctor of the civilians and canonills: And he is

one who is put in the place, flead, or turn, of another an manage his anthere of law: Formerly energialized was obliged to appear in period, to profecula to de-tonal, that fact (according to the old Gothic conflict-tion), aniels by faccial license under the king states patent. This is tall the law in criminal cases, but an idioa cannot to this day appear by attacher, but a person; for he hath not discretion to entire this to appoint a proper substitute: and upon his being brought before the court in fo defenceless a condition, the judges are bound to take care of his interells, and they shall admit the best plea in his behalf that any one present can suggest. But, as in the Roman law, cum olim in ufu fuiffet, alterius nomine agi non poffe, fed, quia boc non minimam incommoditatem babebat, caperunt homines per procuratores luigare; fo, with us, on the same principle of convenience, it is now permitted in general, by divers ancient flatutes, whereof the first is statute West. 2. c. 10. that attorneys may be made to profecute or defend any action in the absence of the parties to the suit. These attorneys are now formed into a regular corps; they are admitted to the execution of their office by the Inperior courts of Westminster-hall; and are in all points officers of the

respective courts in which they are admitted; and as Attorney they have many privileges on account of their attendance there, so they are peculiarly subject to the cen-Attraction fure and animadversion of the judges. No man can practife as an attorney in any of those courts, but such as is admitted and fworn an attorney of that particular court: an attorney of the court of king's bench cannot practife in the court of common pleas; nor vice verfu. To practife in the court of chancery, it is also necessary to be admitted a solicitor therein; and by the statute 22 Gco. II. c. 46. no person shall act as an attorney at the court of quarter-fessions, but such as has been regularly admitted in fome superior court. of record. So early as the statute 4 Hen. IV. c. 18. it was enacted, that attorneys should be examined by the judges, and none admitted but fuch as were virtuous, learned, and fworn to do their duty. And many subsequent statutes have laid them under farther regula-

Letter of atttorney pays by different acts, 6s. By 25 Geo. III. c. 80. the following duties are to 10 paid by every folicitor, attorney, notary, proctor, agent, or procurator, viz. for every warrant to profecute for a debt of 40s. or to defend, a flamp duty of 2s. 6d. And they are to take out certificates annually; and if refident in London, Westminster, the bills of mortality, or Edinburgh, they are now obliged to pay 51 for the same; and in every other part of Great Britain, 31. The duties are under the management of the commissioners of stamps; and every acting solicitor, and other person as above, shall annually deliver in a note of his name and refidence, to the proper officer of the court in which he practiles; the entering officers are to certify notes delivered, and iffue annual cortificates, flamped as above, which must be renewed ten days before the expiration. Refuling to iffue, or improperly iffuing certificates, is a penalty of 50l. and dimages to the party aggrieved. Acting without a penalty of 50l. and incapacity to fue for fees duc.

Radiped memorandum shall be given to the proper officer, of the names of the parties in every action; indin fach cales as used to require precipes. Officers

receive framped memorandums, are to file the framped memorandums, are to file the framped performs not acting made to this act torfeit 51.

The frame of the fram ter terminal a and to file bills in the exchaquer, for any thing concerning the king in inheritance or profits and others may bring bills against the king's attorney. Elis proper place in court, upon any special matters of a criminal nature, wherein his attendance is required; is under the judges on the left hand of the clerk of the crown: but this is only upon folemn and extraordinary occasions; for usually he does not fit there, but within the bar in the face of the court.

ATTOURNMENT; or Attornment, in law, a transfer from one lord to another of the homage and fervice a tenant makes; or that acknowledgment of duty to a new lord.

ATTRACTION, in natural philosophy, a general: term used to denote the cause by which bodies tendAttraction towards each other, and cohere till separated by some other power.

> The principle of attraction, in the Newtonian fense of it, feems to have been first surmised by Copernicus. "As for gravity (fays Copernicus). I consider it as nothing more than a certain natural appetence (appetentia) that the Creator has impressed upon all the parts of matter, in order to their uniting or coalescing into a globular form, for their better preservation; and it is credible that the same power is also inherent in the fun and moon, and planets, that those bodies may constantly retain that round figure in which we behold them." De Rev. Orb. Caleff. Lib. I. cap. 9. And Kepler calls gravity a corporeal and mutual affection between similar bodies, in order to their union. All. Nov. in Introd. And he pronounces more politively. that no bodies whatfoever were absolutely light, but only relatively fo; and confequently, that all matter was subjected to the law of gravitation. Ibid. .

> The first in this country who adopted the notion of. attraction was Dr Gilbert, in his book De Magnete ; and the next was the celebrated Lord Bacon, New. Organ. Lib. II. aphor. 36.45.48. Sylv. Cent. I. exp. 35. In France it was received by Fermat and Robertal & and in Italy by Galileo and Borelli. But till Sie Ifac. Newton applaced, this principle was very imperfectly

defined and applied.

It must be observed, that though this great author makes use of the word attraction, in common with the fehool philosophers; yet he very fludiously diffinguishes between the ideas. The ancient attraction was fupposed a kind of quality, inherent in certain bodies therafelves, and ariling from their particular or specific forms. The Newtonian attraction is a more indefinite principle; denoting not any particular kind or manner of action, not the physical cause of such action; but only a tendency in the general, a conatus accedendi, to whatever cause, physical or metaphysical, such effect be owing; whether to a power inherent in the bound; themselves, or to the impulse of an external ages. themicives, or to the impulse of an external age Accordingly, that author, in his Philosoph. Net. Prin. Math. notes, " that he uses the words attraction, sine pulfi, and properfion, to the centre, indifferently; and cautions the reader not to imagine that he attraction he expresses the modus of the sciion, or the cause thereof, as if there were any proper potthe centres, which in reality are only matter to points; or as if centres could attract. Life I. So he "considers centripetal powers as attraction. though, phylically speaking, it were parhaps more just to call them impulies." Ibid. p. 147 . kle bedt. " that what he calls attraction may pullibly be effected by impulie, though not a common or corpored impulle, or after lome other manner unknown to us."

Optic. p. 322.

Attraction confidered as a quality arising from the special of bodies, ought, together with symmetry of occult qualipathy, antipacity, and the whole teibe of occult qualities, to be exploded. But when we have fet thefe afide, there will remain innumerable phenomena of nature, and particularly the gravity or weight of bodies, or their tendency to a centre, which argue a principle of action feemingly diffinct from impulse, where at least there is no sensible impulsion concerned. Nay, what is more, this action in some respects differs from

all impulsion we know of; impulse being always found Attraction to act in proportion to the furfaces of bodies, whereas gravity acts according to their folid content, and confequently must arise from some cause that penetrates or pervades the whole substance thereof. This unknown principle, unknown we mean in respect of its cause, for its phenomena and effects are most obvious, with all the species and modifications thereof, we call attraction; which is a general name, under which all mutual tendencies, where no physical impulse appears, and which cannot therefore be accounted for from any known laws of nature, may be ranged.

And hence arise divers particular kinds of attraction: as, Gravity, Magnetism, Electricity, &c. which are so many different principles acting by different laws, and only agreeing in this, that we do not fee any physical causes thereof; but that, as to our senses, they may really arise from some power or efficacy in such bodies. whereby they are cuabled to act even upon distant bodies, though our reason absolutely disallows of any such

machine may be divided, with respect to the law the vie, into two kinds.

That the presentation of sensible distance. Such are the attraction of magnetism and electricity, found in particular hodies. The leveral laws and phenomena of each, fee under their respective articles.

fee under their respective articles.

The attraction of gravity, called also among mathematiciant the contributal force, is one of the greatest and most universal principles in all nature. We see and feel it operate on bodies mear the earth, and find by observation that the same power (i. e. a power which acts in the fame manner, and by the fame rules, viz, always proportionably to the fame matter, and as the iquaries of the same respectively does also obtain in the more constant and planets primary and seemed to the same rules and even that this this constant and the same rules are same same Figure which come under her observation, it is easily selected, by one of the fattled rules of philosophyping, that is patient in all others is and short is found to be as the institute of matter in each body, it much he in carrie particle thereof, and fience every particle in native at anomalies metall every other particle. See Equation matter and continues the confidence in the applications of the appropriate the celebral motions, under the applications of the appropriate the applications of the applications of the appropriate the applications of the applications o

From this attraction arises all the motion, and copefequently all the mutation, in the great world. By this heavy bodies descend, and light once ascend; by this projectiles are directed, vapours and exhalations rife, and rains, &c. fall. By this rivers glide, the air prefies, the ocean swells, &c. In effect, the motions ariting from this principle make the subject of that extensive branch of mathematics, called mechanics or flatics, with the parts or appendages thereof, hydroftatics,

pneumatics, &c.

2. That which does not extend to fensible diffances Such is found to obtain in the minute particles whereof bodies are composed, which attract each other as or extremely near the point of contact, with a force much superior to that of gravity, but which at any distance from it decreases much father than the power Attraction of gravity. This power a late ingenious author chooses to call the attraction of cobesion, as being that whereby the atoms or infenfible particles of bodies are united into fensible masses.

> This latter kind of attraction owns Sir Isaac Newton for its discoverer; as the former does for its improver. The laws of motion, percussion, &c. in senfible bodies under various circumstances, as falling, projected, &c. afcertained by the later philosophers, do not reach to those more remote intestine motions of the component particles of the fame bodies, whereon the changes of the texture, colour, properties, &c. of bodies depend: fo that our philosophy, if it were only founded on the principle of gravitation, and carried fo far as that would lead us, would necessarily be very

But beside the common laws of sensible masses, the minute parts they are composed of are found subject to fome others, which have been but lately taken notice of, and are even yet imperfectly known. Sir. Isaac Newton, to whose happy penetration we owe the hint, contents himfelf to establish that there are such me tions in the minima nature, and that they for certain powers or forces, not reducible to the in the great world. In shows, "That the small particle seems and ther even at a distance r and that many of the phenoment of nature are the refult thereof. Semible bodies, we have already observed, act on one another divers ways ; and as we thus perceive the tenor and course of nature, it appears highly probable that there may be other powers of the like kind; nature being very uniform and confident with health. Those just mentioned reach to sensible diffusers, and so have been observed by sulgat eyes; but there may be others which reach to such small the new as have lather to cleaped observation; and the second observation to such distances.

Being excited by friction.

The great author just make the country country of their infrastron from a great manufacture phenomena and experiments, which plainly argue to paragrants and experiments when particles, ... so the paragraph of or viriol and water, apparations and sand failed of airriol and faitpetre. He also shows what should prover, are inequally firing between the rest biodice; firefager, s. g. between the paragraph fait of terter and those of aquatoritis than the paragraph. ver, between aquatortie and lapis calaminaris inchie between iron than copper, copper than lives of man cury. So spirit of vitriol acts on water, but more pairon or copper, &c.

The other experiments which countenance the existence of fuch principle of attraction in the particles of matter are innumerable.

These actions, in virtue whereof the particles of the bodies above-mentioned tend towards each other, the author calls by a general indefinite name attraction; which is equally applicable to all actions whereby difant bodies tend towards one another, whether by impulse or by any other more latent power: and from hence he accounts for an infinity of phenomena, otherwife inexplicable, to which the principle of gravity is

44 Thus (adds our author) will nature be found

very conformable to herfelf and very fimple; perform-Attraction, ing all the great motions of the heavenly bodies by the attraction of gravity, which intercedes those bodies, and almost all the small ones of their parts, by fome other attractive power diffused through the particles thereof. Without such principles, there never would have been any motion in the world; and without the continuance thereof, motion would foon periffi, there being otherwife a great decrease or diminution thereof, which is only supplied by these active princi-

We need not say how unjust it is in the generality of foreign philosophers to declare against a principle which furnishes so beautiful a view, for no other reason but because they cannot conceive how one body should act on another at a distance. It is certain, philosophy allows of no action but what is by immediate contact and impulsion (for how can a body exert any active power there where it does not exist? to suppose this of any thing, even the Supreme Being himself, would perhaps imply a contradiction) : yet we see effects without feeing any fuch impulse; and where there are effect;, we can easily infer there are causes whether we see them or not. But a man may confider such effects without entering into the confideration of the causes, as inficed it feems the business of a philosopher to do't for to exclude a number of phenomena which we do fee, will be to leave a great chaim in the history of nature; and to argue about actions which we do not fee, will be to build cattles in the air .- It follows, therefore, that the phenomena of attraction are matter of physical consideration, and as such entitled to a share in the fystem of physics; but that the causes thereof will only become so when they become sensible, i. e. when they appear to be the effect of fome other higher. causes (for a cause is no otherwise feen than as uself is an effect, so that the first cause must from the nature of things be invilible): we are therefore at liberty to spoofe the causes of attractions what we please, with-any injury to the effects.—The illustrious author felf forms a little irresolute as to the causes; incliming Cometimes to attribute gravity to the action of remineterial carele (Optics, p. 343, &c.), and fome-

the state of a material one (1b. p. 325.)

Chicologhy, the refearch into causes is the last sever somes under confideration till the phenomena of the effect be settled; it being the common that the cause is to be accommon to the sever some that the cause is to be accommon to the cause is to be accommon to the cause in the cause is to be accommon to the cause is the cause is to be accommon to the cause is the cause decire The conference of any, the groflest and most femilite action, is not adequately known. How impulle of personalism itself produces its effects, i. e. how metion is communicated by body to body, confounds the deepell midolophers; yet is impulse received not only into philosophy, but into mathematics; and accordingly the laws and phenomena of its effects make the greatest part of common mechanics.

The other species of attraction, therefore, in which no impulse is remarkable, when their phenomena are fufficiently afcertained, have the same title to be promoted from physical to mathematical confideration; and this without any previous inquiry into their cause, which our conceptions may not be proportionate to: let their causes be occult, as all causes strictly speaking are, so that their effects, which alone immediately con-

cern us, be but apparent.

Ater Ation Attributives.

Our great philosopher, then, far from adulterating science with any thing foreign or metaphysical, as many have reproached him with doing, has the glory of having thrown every thing of this kind out of his fystem, and of having opened a new fource of fubliner mechanics, which duly cultivated might be of infinitely greater extent than all the mechanics yet known. It is hence alone we must expect to learn the manner of the changes, productions, generations, corruptions, &c. of natural things; with all that scene of wonders opened to us by the operations of chemistry.

Some of our own countrymen have profecuted the discovery with laudable zeal; Dr Keill particularly has endeavoured to deduce some of the laws of this new action, and applied them to folve divers of the more general phenomena of bodies, as cohelion, fluidity, elafficity, foftness, fermentation, coagulation, &c.; and Dr Freind, seconding him, has made a further application of the fame principles, to account at once for almost all the phenomena that chemistry presents: fo that some philosophers are inclined to think that the new mechanics should seem already raised to a complete feience, and that nothing now can occur but what we have an immediate folution of from the attractive force.

But this feems a little too precipitate: A principle fo fertile flould have been further explored; its particular laws, limits, &c. more industriously detected and laid down, before we had proceeded to the application. Attraction in the grofs is so complex a thing, that it may folve a thousand different phenomena alike. The notion is but one degree more simple and precise than action itself; and, till more of its properties are ascertained, it were better to apply it less and fludy it more. It may be added, that some of Sir Isaac Newton's followers have been charged with falling into that error which he induftriously avoided, viz. of considering attraction as a cause or active property in bodies, not merely as a phenomenon or effect.

ATTRACTION of Mountains. See MOUNTAINS. Elective ATTRACTION. See CHEMISTRY, Inden. ATTREBATH. Sec ATREBATIS.

ATTRIBUTE, in a general fenfe, that which agrees with some person or thing; or a quality determining fomething to be after a certain manner . Thus understanding is an attribute of mind, and est an attribute of body. That attribute which the conceives as the foundation of all the reil, is called its effential attribute; thus extension is by some, and solidity by others, esteemed the estential attributes of body or matter.

ATTRIBUTES, in theology, the feveral qualities or perfectious of the Divine nature.

ATTRIBUTES, in logic, are the predicates of any subject, or what may be affirmed or denied of any

ATTRIBUTES, in painting and sculpture, are symbols added to feveral figures, to intimate their particular office and character. Thus the eagle is an attribute of Jupiter; a peacock, of Juno; a caduce, of Mercury; a club, of Hercules; and a palm, of Victory.

ATTRIBUTIVES, in grammar, are words which are figuificant of attributes; and thus include adjectives, verba, and particles, which are attributes of fubilances; and adverbs, which denote the attributes only of attri-

butes. Mr Harris, who has introduced this distribu- Autrition tion of words, denominates the former attributives of the first order, and the latter attributives of the second

ATTRITION, the rubbing or striking of bodies one against another, so as to throw off some of their fuperficial particles.

ATURÆ, an ancient town in the district of Novempopulana in Aquitania, on the river Aturus; now Aire in Gascony, on the Adour. E. Long. o. 3 N. Lat. 43. 40.

AVA, a kingdom of Asia, in the peninsula beyond the Ganges. The king is very powerful, his dominions being bounded by Mogulstan on the west, Siam, on the fouth, Tonquin and Cochin-China on the cast, and by Tibet and China on the north. Several large rivers run through this country, which annually overflow their banks like the Nile, and thus render it extremely fertile. Here are mines of lead and copper, together with some of gold and filver, befides large quantities of the finest oriental rubies, fapphires, eme-

raids, &c.

AUCH, a city of France, the capital of the county of Armagnae, and the metropolis of all Gascony. The archbillsop assumes the title of primate of Aquitain. It lies on the fummit and declivity of a very Reep hill, which is furrounded by other hills that rife at a small distance; and through the vale below runs a rivulet, called the Gers. The inhabitants at about 6000; the buildings are modern and elegant; the streets, though in general narrow, yet are clean and

Auditor.

Auction well paved. In the centre of the city stands the cathedral, which is one of the most magnificent in France, both as to its construction and the internal decorations. The painted windows are only inferior to those of Gouda in Holland. The chapels are of equal beauty, and ornamented at a prodigious expense. The revenues of the fee of Auch amount annually to three hundred thousand livres. The palace is a very handfome building; and its apartments are furnished with a voluptuous Iplendour, rather becoming a temporal than a spiritual prince. E. Long. o. 40. N. Lat. 33. 40.

AUCTION, a kind of public fale, very much in use for household goods, books, plate, &c. By this method of fale the highest bidder is always the buyer. This was originally a kind of fale among the ancient Romans, performed by the public crier fub baffa, i.e. under a spear stuck up on that occasion, and by some magistrate, who made good the fale by delivery of the

goods.

AUDEANISM, the same with anthropomorphism. Sec Anthropomorphites.

AUDEUS, the chief of the Andeans, obtained the name of a heretic, and the punishment of besishment, for celebrating Easter in the manners of the lews, and attributing a human form to the Delv. He died in the country of the Goths, about the 1011 37 2

AUDIENCE given to ambaffadors, a ceremony observed in courts at the admission of ambassadors or

public miniflers to a hearing

In England, audience is given to ambaffadors in the be. Upon being admitted, as is the custom of all courts, they make three bows; after which they cover and fit down, but not before the king is covered and fat down, and has given them the fign to put on their hats. When the king does not care to have them expected, and fit, he limitelf flands uncovered; which is taken as a flight. At Constantinople, ministers usually and the surface of the manichest and the surface of the surface of the surface of the manichest and the surface of the surface o prefence chamber; to envoys and relidents, in a galhave audience of the prime vizier.

Audience is also the name of a court of inflice eflablished in the West Indies by the Spanisards, and fivering in effect to the parliament in France, courts take in feveral provinces, called alle ces, from the name of the tribunals to which the

AUDIENCE is also the name of an ecclesiaftical cone held by the archbilliop of Canterbury, wherein diffe rences upon elections, confecrations, isthitutions, marringes, &c. are heard.

AUDIENDO et TERMINANDO, a writ, or rather a rommillion to certain persons, when any infurrection or great riot is committed in any place, for the appeal-

ing and punishment thereof.

AUDIENTES, or Auditores, in church history, an order of catechumens; confifting of those newly infiructed in the mysteries of the Christian religion, and not yet admitted to baptism.

AUDIT, a regular hearing and examination of an AUDITOR, in a general sense, a hearer, or one

billens or attends to any thing.

AUDITOR, according to our law, is an officer of the Auditor king, or fome other great person, who, by examining yearly the accounts of the under officers, makes up a Auditory. general book, with the difference between their reccipts and charges, and their allowances to alloca-

Auditor of the Receipts, is an officer of the exchequer who files the teller's bills, makes an entry of them, and gives the lord treasurer a certificate of the money received the week before. He also makes debentures to every teller, before they receive any money, and takes their accounts. He keeps the black book of receipts, and the treasurer's key of the treasury, and fees every teller's money locked up in the new treafury.

AUDITORS of the Revenue, or of the exchequer, officers who take the accounts of those who collect the revenues and taxes raifed by parliament, and take the accounts of the theriffs, escheators, collectors, tenants, and cultomers, and let them down in a book, and per-

fect them.

The proves of the Prest and Imprest, officers of the ex-classics, who take and make up the accounts of Ire-land. Derwick, office mint, and of any money impressed to any man in the base of the way. They received pone-dage on all softmate valled by them, which amounted to a predigious sum, openally in time of way. But the office is now abolished, and L. 7000 a year given to the incumberes of

AUDITORY Nerves. See ANATOMY, p. 760.

AUDRAN, (Claude), a French engraver, the first of the celebrated artists of that name, was the son of Lewis Audran, an officer belonging to the wolf-hunters, in the reign of Henry IV. of France; and was born at Paris in 1592. He never made any great progress in the art; so that his prints are held in little or no estimation. Yet though he acquired no great reputation by his own works, it was no small honour to him to be the father of three great artists, Germain, Claude, and Girard: the last of whom has immortalized the name of the family. Claude Audran retired from Paris to Lyons, where he resided, and died in 1677.

AUDRAN (Carl), a very eminent engraver, was brother to the preceding, though fome aftert he was they his counn german; and was born at Paris in 1501 In his infancy he discovered much takes as a great dis-position for the arts; and a period his elf in engrav-ing, which he appears to have been chiefly fined or, he went to Monie, where he produced feveral prints that did him great honour. At his return, he adopted that species of engraving which is performed with the graver only. He lettled at Paris, where he died in 1072, without having ever been manual. The Abbe March les, who always speaks of the mail with great praise, attributes 150 prints to him amongst which, the annunciation, a middling due bitter appright, from Annuabale Carracci, and the state of the said of the the early part of his life to make of Carl, till plates with the initial with 100 and the letter Kenty when, for distinctions of the he wild the letter Kenty when his name Karl, with the Kintend of the Carl wrote his name Kad, with the K inflesd of the Ca Augean (Germain), the eldelt fon of Clande men tioned if the preceding article but one, was born in this at Lyons, where his parents then relided. Not contest with the infructions of his lather still went to Paris, and perfected himself under his state Carry to that, upon his return to Lyons, he published favour prints which did great honour to his graver. His misrit was in such estimation, that he was made a member of the academy established in that town, and chofen a professor. He died at Lyons in 1710, and left behind him four fons, all artists; namely, Claude, Benoit, John, and Louis.

AUDRAN (Claude), the fecond of this name, and fecond fon to Claude above mentioned, was born at Lyons in 1639, and went to Rome to study painting; where he succeeded so well, that at his return he was employed by Le Bruo to affish him in the battles of Alexander, which he was then painting for the king of France. He was received into the Royal Academy in the year 1675, and died unmarried at Paris in 1684. His virtues (says Abbé Fontenai) were as praiseworthy as his talents were great. M. Hemeken

mentions this artifl as an engraver, without specifying Auditary any of his works in that line.

AUDRAN (Girard, or Gerard), the most celebrated artift of the whole family of the Audrans, was the third fon of Claude Audran mentioned in a preceding article, and born at Lyons in 1640. He learned from his father the first principles of design and engraving; and following the example of his brother, he left Lyons and went to Paris, where his genius foon began to manifest itself. His reputation there brought him to the knowledge of Le Brun, who employed him to engrave the battle of Conflantine, and the triumph of that emperor; and for these works he obtained apartments at the Gobelins. At Rome, whither he went for improvement, he is faid to have findied under Carlo Maratti, in order to perfect himself in drawing; and in that city, where he refided three years, he engraved foveral fine plates. M. Colbert, that great encourages of the arts, was so struck with the beauty of Audran's works whilft he refided at Rome, that he perfunded Louis KIV. to recal him. On his return, he applied himfelf affiduously to engraving; and was appointed engraver to the king, from whom he received great encouragement. In the year 1681 he was named counfellor of the Royal Academy; and died at Paris in 1703: He had been married; but left no male iffue bebind him.

The great excellency of this artifl above that of any great my other engraver was, that though he drew admirably to the himlelf, yet he contracted no manner of his own'; but transcribed on copper simply, with great trath and fpirit, the flyle of the mafter whose pictures he cope it. On viewing his prints you lofe fight of the engine . and naturally fay, it is Le Brun, it is Pouffin, it is Mignard, or it is Le Sueur, &c. as you turn to the prints which he engraved from those matters. I.: any one examine the battles above mentioned from Brun, the prefervation of the young Pyribue from Sicholas Pouffin, the peft from Mignard, and the merpredom of St Lawrence from Le Sueur, and then july ? fundidly of the truth of this observation. The following judicious observations by the Abbe Fonten. taken chiefly from M. Bafan, with fome fmull varietion and additions, will fully illustrate the ments of Audran. "This fublime artift, far from con-tribat a fervile arrangement of flrokes, and the cruicarty cold and affected clearness of the grayer were the great effentials of historical engraving, part worth to his works by a bold mixture of fice order, but with an inimitable degree of talle; and has left to patterity most admirable examples of the flyle in which grand compositions ought to be treated. His greatest works, which have not a very flattering appearance to the ignorant eye, are the admiration of true connoilleurs and persons of fine taste. He acquired the most profound knowledge of the art by the confiant attention and fludy which he beltowed upon the science of design, and the frequent use he made of painting from nature. This great man always knew how to penetrate into the genius of the painter he copied from; often improved upon, and fometimes even furpaffed him. Without exception, he was the most celebrated engraver that ever existed in the histo-

4 O 2

1.2

Auditur. right line. We have several subjects which he engraved from his own defigns, that manifeked as much take as character and facility. But, in the battles of Alexander, he surpassed even the expectations of Le Brun himfelf." These confist of three very large prints, lengthwife, each confishing of four plates, which join together, from Le Brun; namely, the passage of the Granicus; the battle of Arbela; Porus brought to Alexander, after his defeat .- To this fet are added two more large prints lengthwife, on two plates each, also from Le Brun, as follow: Alexander entering the tent of Darius; and The triumphal entry of Alexander into Bubylon. The former was engraved by Girard Edelink, and the latter by Girard Audran. It is to be remarked of all these plates, that those impressions are generally most esteemed which have the name of Govton the printer marked upon them. The Pell, from Peter Mignard, a large plate, lengthwite, alfo deferves particular notice. In the first impressions, the figure in the clouds is Juno with her peacock behind her; in the latter, the peacock is obliterated, and the wings of an angel are added to the figure.

AUDRAN (Benoit), the second son of German, An dian, was born at Lyons in 1661, where te to the ed the first principles of delign and engraving the inflruction of his father. But foon after policy Pario, his uncle Girard Audran took him under his tuition; and Benoit fo greatly profited by his influictions, that though he never equalled the fublime kyle: of his tutor, yet he deservedly acquired great reputation. Nay, the Abbe Fontena adds this enlogium; "West mire in his works a share of those beauties which we find in the engravings of the illustrious Girard." He was honoured with the appellation of the king's cappaver. and received the royal pension. He was made an acar demician, and admitted into the council in 1915. The died unmarried at Louzouer, where he had in ettate; in 1721. His manner was founded upon the bold clear five of his uncle. His outlines were firm and determined his drawing correct; the heads of his figures, and general very expressive; and the other extremities marked. His works, when compared with those of his uncle, appear to want that mellownels and banking my which are so conspicuous in the latter; and the round dots with which he his field upon the lights are often too present in his most finished plates, we find the meeting of the engraving extremely next, and meeting great taste and judgment. Among his are training from the cup which his physician him: a circular plate, from Le Santon.

August (John), the third for all familiation dian, was burn at Lyons in 1007; and, flor limits received infiructions from his fallier, what be Paul to perfect himself in the art of engraving under his uncle Girard Audrau. At the age of so years, the genius of this great artist began to display itself in a surpriling manner; and his foruse funcefs was fuch, that in 1707, he obtained the title of engineer to the king, and had a penfion allowed him by his majerty, with apartments in the Gobelins; and the following year he was made a member of the Royal Academy. He was 80 years age before he quitted the graver; and near 90 was a died at his apartments affigned

him by the king. He left three fons behind him; one Amiran of whom was also an engraver, as we shall see below. "The most masterly and best prints of this artist (in Mr Strutt's opinion) are those which are not so plea-sing to the eye at sirst fight. In these the exching constitutes a great part; and he has finished them in a bold rough ityle. The scientisic hand of the master appears in them on examination. The drawing of the human figure, where it is shown, is correct. The heads are expressive and finely finished; the other extremities well marked. He has not, however, equalled his nucle. He wants that harmony in the effect : his lights are too much and too equally covered; and there is not sufficient difference between the style in which he has engraved his back grounds and his draperies. This observation refers to a fine print by him of Athalinh, and fuch as he engraved in that flyle. At other times he feems almost to have quitted the point, and substituted the graver. But here I think be has not fo well increeded. The effect is cold and filvery : fer, for example, the Andromache from Sylvestre. One of

for example, the Andromache from Sylvestre. One of his set stocked points, in this neat style, seems to me to the set of send of the from Ant. Coypel."

AVENA, oars: A genus of the digynia order belonging to the triandria class of plants; and in the natural method ranking under the 4th order, Gramina. The calyx has a double valve, and the awn on the Back is contorted. The species are 13; fix of them natives of Britain; viz. 1. The nuda, or naked oats.

2. The fatua, or bearded out grais. 3. The praterfis, or meadow oat grais. 4. The pubelcens, or rough oatgrafs. 5. The elatior, or tall out grafs. 6. The flavefcens, or yellow oat grafs. It is remarkable, that the native place of the fativa, or common oat, cultivated in our nelds, is almost totally unknown. Anson fays, that he observed it growing wild or spontaneously in the island of Juan Fernandez. But a vague observation from an author of that kind is not to be depended on. For the culture, fee AGRICULTURE, Nº 137.

Oats are an article of the materia medica. Gruels made from them have a kind of fost mueilaginous quality; by which they obtund acrimonious humours, and prove uleful in inflammatory diseases, coughs, hoarse-

nels, and exulcerations of the fauces.

AVENACEOUS, fomething belonging to or par-

taking of the nature of oats.
AVENAGE, in law, a certain quantity of oats paid venue is about 6000 ducats (11251.) a year. The by stenant to a landlord, instead of rent or some other

AVENCHE, an ancient city of Switzerland, in the cauton of Bern, formerly the capital of all Switzerland, hat now hows its former greatness only by its ruins.

E. Long. 7. 7. N. Lat. 46. 50.

AVENES, a small but strong town in French Flander, in the county of Hainault, feated on the river Theface. It contains about 2500 inhabitants; but the houses are wretchedly built, and the streets irregular. It was fortified by M. Vauban in a strong regular man-About this place are a prodigious number of Assautiones proper for building, and used by sculptors for flatuers they are known by the name of Stones of

AVENIO, an ancient town of the Caveres, and one of the mail opulent in Gallia Narbonensis; now Avig-

uppe an Provence. See Avignon.

AVENOR, an office belonging to the king's stables, to provides oats for the hories. He acts by warrant

Ashe master of the horse.

This work, which gained its author great reputation, was first published in 1554, by Jerome Zielglerus, professor of poetry in the university of Ingolfladt; and afterwards at Balil in 1580, by Nicholas Cifner. An affront which Aventine received in the year 1529, stuck by him all the rest of his life: he was forcibly taken out of his fifter's house at Abensperg, and hurried to a jail; the true cause of which violence was never known: but it would probably have been carried to a much greater length, had not the duke of Bavaria interposed, and. Avendinus taken this learned man into his protection. Mr Bayle remarks that the incurable melancholy which from this Avenue time poffessed Aventine was so far from determining him to lead a life of celibacy, as he had done till he was 64, that it induced him perhaps to think of marrying. The violence of this new pallion was not, however, fo great, but that it suffered him to advise with two of his friends, and confult certain passages of the Bible relative to marriage. The result was, that it was best for him to marry; and having already lost too much time, confidering his age, he took the first woman he met with, who happened to be his own maid, ill tempered, ugly, and extremely poor. He died in 1534 aged 68; leaving one daughter, who was then but two months old. He had a fon, who died befores

AVENTINUS MONS, one of the feven hills on which ancient Rome flood. The origin of the name Aventinus is uncertain : but this hill was valle called Murcius, from Murcia the goddels of floth, whe had a little chapel there ; and Collis Diane, from the temple of Diana; likewise Kemonius, from Remus, who wanted to build the city, and who was buried there, It was the ken within the compals of the city by Angus Marcius. To the east it had the city walls; to the fourth the Came pus Figuliaus; to the well, the Tiber; and to the mark Mons Palatinus: in circuit two miles and a comment

AVENTURE, in law books, means a minichance causing the death of a person without selonyi (A a)

AVENUE, in gardening, a walk planted on cachfide with trees, and leading to a houle, garden gates wood, &c. and generally terminated by tome different object.

All avenues that lead to a boule ought to be at least as wide as the whole front of the house, if wider they are better still, and avenues to woods and prospects ought not to be less than 60 feet wide. trees should not be planted nearer to one another than 35 feet, especially if they are trees of a spreading kind; and the same ought to be the distance, if

are for a regular grove.

The trees most proper for avenues with us. English elm, the lime, the horse chesnut, the common chefout, the beech, and the abele. The English will do in all grounds, except fuch as are very to thallow, and this is preferred to all others. shallow, and this is preferred to all other the cause it will bear cutting, heading or logical manner, better than most others. The round growth; this is a tree which will bear semesting well; it is also green almost as foon as any plant ever in spring, and continues for the same as the same an incomparable hedge, and is particulate to all makes an incomparable hedge, and in professiols to all other trees for lofty espaliers. The line is all in the its natural growth and fine fante. The poste the land is proper for all places that are not too much exposed to rough winds. The common chefunt will do very well in a good foil; and rifes to a confiderable height, when planted fomewhat close; though when it stands fingle, it is rather inclined to spread than to grow tall. The beech it a beautiful tree, and naturally grows well with us wild flate; but it is less to be chosen for avenues the before mentioned, because it does not bear transmitting well, but is very subject to miscarry. Laitly, The abele is for any foil, and is the quickest

grower of any forest tree. It seldom fails in trans- Avenzour. planting; and succeeds very well in wet soils, in which the others are apt to fail. The oak is but little used for avenues because of its flow growth.

The old method of planting avenues was with regular rows of trees, and this has been always kept to till of late : but we have now a much more magnificent way of planting avenues; this is by fetting the trees in clumps, or platoons, making the opening much wider than before, and placing the clumps of trees at about 300 feet distant from one another. In each of these clumps there should be planted either of seven or nine trees; but it is to be observed, that this is only to be practifed where the avenue is to be of some confiderable length, for in short walks this will not appear fo fightly as fingle rows of trees. The avenues made by clumps are fittest of all for parks. The trees in each clump should be planted about 30 feet afunder; and a trench should be thrown up round the whole clamp, to prevent the deer from coming to the trees

to bark them. AVENZOAR, BEU MERWAN ANDALMALEC EBN an eminent Arabian physician, slowished about the entire of the establishment of the beginning of the twelfth senters; the establishment is the beginning of the twelfth senters; the senters of the beginning of the twelfth senters; the senters of the beginning of the twelfth of the senters of the senters of the senters. He extended his sentence of the senters of the sentence of the senters of the sentence of the senters of the sentence of t gent rays. Dr Feeled writes,

traffer reckoned at captric but Dr Freind observet, that this character fuits him less than any of the rest of the Arabians. "He was bred," continues that author, " in a physical family, his father and grandfather being both practitioners, whom he always remembers with great gratitude and honour. We have his own testimony that he had a regular education; and that he not only learned what properly belongs to a physician, but out of a great defire of knowledge, every thing besides which relates to pharmacy or surgery." Dr Freind afterwards observes, " that he was averse to quackery, and rejects the idle superflitions of aftrologers; and throughout all his work professes himAverage felf to much of the dogmatical or rational feet, which was directly opposite to the empirical, that he has a great deal of reasoning about the cautes and symptoms of diftempers; and as in his theory he chiefly, if not only, follows Galen, fo he quotes him upon all occasions, oftener than the rest of the Arabians do. Nothwithstanding he is so Galenical, there are feveral particulars in him which feldom or never occur in other authors; and there are some cases which he relates from his own experience, which are worth peruling." He wrote a book entitled, Tayaffir filmulawat waltadbir, i. e. "The method of preparing medicines and diet;" which is much esteemed. This work was translated into Hebrew, in the year of Christ 1280, and thence into Latin by Paravicius, whose version has had feveral editions. The author added a supplement to it, under the title of Jame, or a Collection. He also wrote a treatise Filadwiyat wa'laughdiyat, i. e. " Of Medicines and Food;" wherein he treats of their qualities.

AVERAGE, in commerce, fignifies the secidents

AVERAGE, in commerce, fignifies the accidents and misiortunes which happen to think and interesting ones, from the time of their instance, and father in their return and unloading and a district interest kinds. I. The implie of the fathers and the think which condition in the extraordinal property instanced the happing along or for the metabolism property instanced the happing along the form, mails, and rigging, conditional tracking operations accidents at the time the property of the metabolism and the father than the first than the father than the first which further the damage. The world is the thing which furthered the damage. The strength and then average, being those expenses a light with and common average, being those expenses a light with with and common average, being those expenses a light with with a damage of ultrained, for the common most and string which of fulfatined, for the common to a wint both of the merchandist and the service of the common to the service of th by the fate and compo-whole. Of the pa-en for the sealou-thrown overhead; beauty of anosyting and and the present thulbergus merchant mile to merchant is lightly and the light of the lightly and the lightly and the lightly and the lightly and the lightly at the lightly which those merchants, who lead goods in seether man's flup, pay to the matter for his care of them over and shove the freight. Hence it is expressed in the bills of lading, paying so much freight for the said goods, with primage and average accultomed.

AVERDUPOIS. See Avoirdupois. AVERNUS, a lake of Campania in Italy, near Baise, famous among the ancients for its poisonous qualities. It is described by Strabo as lying within the Lucrine bay, deep and darksome, surrounded with fleep banks that hang threatening over it, and only accessible by the narrow passage through which you fail in. Black aged groves itretched their boughs over the watery abyls, and with impenetrable foliage excluded almost every ray of wholesome light; mephitic

vapours afcending from the hot bowels of the earth, Averus being denied free passage to the upper atmosphere, floated along the furface in poisonous miss. These circumstances produced horrors fit for fuch gloomy deities; a colony of Cimmerians, as well fuited to the rites as the place itself, cut dwellings in the bosom of the furrounding hills, and officiated as priefts of Tartarus. Superstition always delighting in dark ideas, early and eagerly feized upon this spot, and hither the led her trembling votaries to celebrate her difmal orgies; here she evoked the manes of departed heroeshere she offered facrifices to the gods of hell, and attempted to dive into the fecrets of futurity. Poets enlarged upon the popular theme, and painted its awful feenery with the strongest colours of their art. Homer brings Ulyfics to Avernus, as to the mouth of the infernal abodes; and in imitation of the Grecian bard, Virgil conducts his hero to the same ground. Whoever failed thither, first did facrifice; and endeavoured to propitiate the infernal powers, with the affiftance of some priests who attended upon the place, and directed the myssic performance. Within, a fountain of pure water broke out just over the fea, which was fancied to be a wein of the river Styx; near this fountain was the dracle: and the hot waters frequent in those parts were improved to be branches of the burning Philege-thon. The poisonous effluvia from this lake were faid to be fo firming, that they proved fatal to birds endeawas the lake itself, but to the cavern near it, which which the poets feigned a descent to hell. Hence the proper name of the lake is Lacus Averni, the " lake near the cavern," as it is called by some ancient au-MOTE.

he holinels of these shades remained unimpeached many ages: Hannibal marched his army to offer ale at this altar; but it may be suspected he was to this act of devotion rather by the hopes of fur-ing the garrison of Putcoli, than by his piety. Aflong seign of undiflurbed gloom and celebrity, finden glere of light was let in upon Avernus; the definition were dispelled, and with them vanished the sation of the lake: the axe of Agrippa brought its. Its ground, disturbed its sleepy waters with gree room for all its malignant effluvia to the sindence of these exhalations, as described as the sations, has appeared to very extraorminate the sations, who know the place in a season writers, who know the place in a season writers, who know the place in a season the sation. But stopping these accounts with exaggeration has sation maw: he observes the air is severish responds for seven now; he observes the air is severish and dangerous, as the saundiced faces of the vine-dreffera; who have Inceceded the Sibyls and the Cimmerians in the possession of the temple, most rucfully testify. Boccaccio relator, that, during his relidence at the Neapolitan court, the furface of this lake was fuddenly covered with dead 6th, black and finged, as if killed by some subaqueous eruption of fire.

At prefent the lake abounds with tench; the Lucrine with cels, The change of fortune in these lakes is fingular: In the splendid days of imperial Rome the Lucrine was the chosen spot for the brilliant parties of pleafure of a voluptuous court: now, a flimy bed of rushes covers the scattered pools of this once

beautifut?

LXXV.

Part 2.

Averthon. beautiful sheet of water ; while the once dusky Avernus is clear and ferene, offering a most alluring surface and charming scene for similar amusements. Opposite to the temple is a cave usually styled the Sibyl's grotto; but apparently more likely to have been the mouth of a communication between Cuma and Avernus, than the abode of a prophetes; especially as the Sibyl is positively faid by historians to have dwelt in a cavern under the Cumean citadel.

AVERRHOA in botany: a genus of the decandria order, belonging to the pentagynia class of plants; and in the natural method ranking under the 14th order, Gruinales. The calyx has 5 leaves, the petals are 5, opening at top; and the apple or fruit is pentagonous, and divided into 5 cells. These are 3 species, viz. the blimbi, the carambola, and the scida, all na-

Pbil. Tranf.

tives of the Indies. The second of these, the carambola, called in Bengal the camrue or camrunga, is remarkable for possessing a power formewhat fimilar to those species of minute which are termed fenfitive plants; its leaves, on being touched, moving very perceptibly. In the minute the moving faculty extends to the branches; but from the hardness of the wood, this cannot be expected with camrunga. The leaves are alternately pignated. an odd one; and their most common polition in the day time are horizontal, or on the fame plane with the branch from which they come out. On being touch ed, they move themselves downward, frequently is to great a degree, that the two opposite almost course one another by their under fides, and the yearn, so fometimes either come into contact or even just each other. The whole of the leaves of one pinns move by ftriking the branch with the nail of the finger of other hard substance: or each leaf can be moved further, by making an impression that shall not extend beyond that leaf. In this way the leaves on one fale of the plant may be made to move, one after another, whill opposite continue as they were: or you may them move alternately, or in thort in the please, by touching in a proper manner the with to put in motion. But if the though made on a fingle leaf, be firrong, and on that pinna, and loanctimes on the store, will be affected by it. Nogwithfian parent fensibility of the leaf, however, his may be made in it with a poor of large out occasioning the smallest most in the cut almost entirely off, and the matter continue unmoved, when by too has the leaf with the singer or point ones, will be affected by it. Nozwithfin continue unmoved, when by too thing the doubles leaf with the finger or point of the feliliars minion will take place as if no joint and bind offered. The reason of this is, that although the head of the allegation part which moves, it is in fact entirely palline, and the periods is the fest both of leafe and wition; and the periods is the fest both of leafe and wition; for although the leaf may be ext in please, or fqueezed with great force, provided its draftion be not changed without any motion being occalioned; yet if the impression on the leaf he made in fach a way to affect the periolus, the motion will take place. therefore it is wanted to confine the motion to a fingle least u either touch it fo as only to affect its own or without meddling with the leaf, touch the with any imall pointed body, as a pin or knife. By compressing the universal petiolus near the place

where a partial one comes out, the leaf moves in a few Averthos feconds in the same manner as if you had touched the partial petiolus.

Whether the impression be made by puncture, percustion, or compression, the motion does not instantly follow: generally feveral feconds intervene, and then it is not by a jerk, but regular and gradual. Afterwards when the leaves return to their former fituation, which is commonly in a quarter of an hour or lefs, it is in so slow a manner as to be almost impercep-

tible. On flicking a pin into the univerfal petiolus at its origin, the leaf next it, which is always on the outer fide, moves first, and then the leaf on the opposite fide, next the second leaf on the outer, and so on. But this regular progression seldom continues throughout ; for the leaves on the outer fide of the pinns feem to be affected both more quickly, and with more ener-The outer fide frequently moves as foon as the third on the inner; and foretimes a leaf, especially on the inner does not move at all, whilf those above and beinfected as their proper time. Sometimes at the actions move fooner at the actions move fooner and the actions with a series of the periods, periods are the composite part of the periods, move fooner into the action of the periods, move fooner into the action of the periods, move fooner into the action of the periods, move fooner into the contract of the periods and the periods are the periods at the periods are the periods at the periods at the periods are the periods at the periods at the periods are the periods at the period at the periods at the inner; and formetimes a leaf, especially on the inner hippien to be bloom by the on i but when a branch de die wind with-

is the hearth down as the wood, the figure of the manch as such as suc tabell the bark, does not for the first day affect the leaves, either in elinis polition or their apritude for motion. In a branch, which was cut through in fuch a manner as to leave it suspended only by a little of the bark no thicker than a thread, the leaves next day did not rife to high as the others; but they were green and fresh, and, on being touched, moved, but is a much less degree than formerly.

After fundet the leaves go to fleep, first moving down so as to touch one another by their under fidea; they therefore perform rather more extensive motion at night of themselves than they can be made to do in the day time by external impressions. With a convex lens the rays of the fun may be collected on a leaf to Averlion.

Averroes as to burn a hole in it, without occasioning any motion. But upon trying the experiment on the petiolus, the motion is as quick as if from strong percussion, although the rays be not fo much concentrated as to cause pain when applied in the same degree on the back of the hand. The leaves move very fast from the electrical shock, even although a very gentle one.

AVERROES, one of the most subtile philosophers that ever appeared among the Arabians, flourished at the end of the 11th and beginning of the 12th centu-He was the son of the high priest and chief judge of Corduba in Spain: he was educated in the university of Morocco; and studied natural philosophy, medicine, mathematics, law, and divinity. After the death of his father, he enjoyed his posts; but notwithflanding his being exceeding rich, his liberality to men of letters in necessity, whether they were his friends or his enemies, made him always in debt. He was afterwards stripped of all his posts, and thrown into prison, for herely; but the oppressions of the judge who succeeded him, caused him to be restored to his former employments.

He died at Morocco in the year raph He was excellively fat, though he stedent orace day. He from all his nights in the study of maintenant, paid when he was fatigued, amufed himself setting the machine was was fatigued, amused himled swith relative species of history. He was never less to play at any same, or to passing the may discussed. He was automated sond and discharacters works, and was exponentiatives on thom, whence he was flyled. The continuous of passing of the historic wrone is used on the solid one of physics, and many amorous some of the mission of the power old, he three their less historics. That when he was pound, he may prove the high proper in this he has a That when he was pound. upon which he had been been a to a long of per Soft rise

The Avervoift, who held the loud was access cording to reason or philosophy, yet presented in mit to the Christian theology, which declares it immortal. But the diffinction was held suspicious; and this divorce of faith from reason was rejected by the doctors of that time, and condemned by the last council of the Lateran under Leo X.

AVERRUNCI (DEI); certain gods, whose businels it was, according to the Pagan theology, to avert misfortunes. Apollo and Hercules were of the number of these gods among the Greeks; and Castor and Pollax among the Romans.

AVERSA a town of Italy in the kingdom of Naples, with sifhop's fee. It is fituated in a very fine plain, in E. Long. 14. 20. N. Lat. 41. 0.

AVERSION, according to Lord Kames, is opposed to affection, and not to defire, as it commonly is. We Vol. II. Part II.

have an affection to one person; we have an aversion to another; the former disposes us to do good to its object, the latter to do ill.

AVERTI, in horsemanship, is applied to a regular flep or motion enjoined in the lessons. In this fense they say pas averte, sometimes pas ecouté, and pas d'ecole, which all denote the fame. The word is mere French. and fignifies advised.

AVES, one of the Carribee islands, 451 miles fouth of Porto Rico, with a good harbour for careening of ships. It is so called from the great number of birds that frequent it. There is another of the same name lying to the northward of this, in N. Lat. 45. 0.; and a third near the eastern coast of Newfoundland, in N. Lat. 50. 5.

Aras, Birde, the name of Linnaus's fecond class of animals. See Zoology, No 8. and ORNITHOLOGY.

AVESBURY, (Robert), an English historian, of whom little more is known than that he was keeper of the reginery of the court of Canterbury in the reign of Edward III. and consequently that he lived in the 14th century. He wrote, Memorabilia gesla magnissici ergis Anglie domini Edwardi tertii post conquestum, prosormque: tallis primitus quibusclam gestis de tempore patris sui domini Edwardi secundi, que in reguis Anglia, Scotia, et Francia, ac in Aquitania et Britannia, non humana sed Dei potentia, contigerunt, per Robertunde Avelbury. This hiltory ends with the battle of Poictiers, about the year 1356. It continued in manu. script till the year 1720, when it was printed by the induferious Thomas Hearne at Oxford, from a manuscript belonging to Sir Thomas Scabright. It is now become very fearce.

AVEZZANO, a town of Italy in the kingdom of Naples, in the Farther Abruzzo. It is built on an almost imperceptible declivity, one mile from the lake of Celano, to which an avenue of poplars leads from be baronnial castle. This edifice stands at a little diance from the town, is fquare, and flanked with towers; was erected by Virginio Orlini, to which family this aid inany other great lordishps belonged, before they were wrested from them in times of civil war, and deried to the Colonnas. Avezzano was founded to the contains 2700 inhabitants, and two relirepresentation within its walls, which are indeed throws condition. The houses are in general throus condition. The houses are in general but there are some large buildings and opulent the glass of gentlemen, not possessed of fees

AUSE Rentery of Normandy in France, which gives title to a viscount. It extends from Falaife and Argenton as far as the fea, between the rivers Dives, Wie and Tougues. The arable land is ftiff, and produces but little good com t but they fow fainfoin; which fucceeds to well that they have five good crops fuccessively; they likewife fow flax and hemp; and have a vast quantity of apples, with which they make cyder. Horses are bred here in great numbers; and the inhabitants fatten the oxen which come from Poictou and Brittany.

AUGEAS, in fabulous history, was king of Elis, and particularly famed for his stable, which contained 3000 oxen, and had not been cleaned for 30 years. Hercules was defired to clear away the fifth from this stable in one day; and Augens promised, if he perAvert Augea.

Augment formed it, to give him a tenth part of the cattle. This talk Hercules is faid to have executed by turning the course of the river Alpheus through the stable; when Augeus refufing to it and by his engagement, Hercules flew him with his arrows, and gave his kingdom to Phyleus his fon, who had shown an abhorrence of his father's infincerity.

AUGMENT, in grammar, an accident of certain tentes of Greek verbs, being either the prefixing of a fyllable, or an increase of the quantity of the initial

AUGMENT'ATION, in a general fense, is the act of adding or joining fomething to another with a defign to render it large.

AUGMENTATION is also used for the additament or thing added.

AUGMENTATION was also the name of a court erect. ed 27 Hen. VIII. fo called from the augmentation of the revenues of the crown, by the suppression of religrous houses; and the office full remains, wherein there are many curious records, though the court has been diffolved long fince.

AUGMEN CATION, in heraldry, are additional charges to a coat armour, frequently given as particular marks: of honour, and generally borne either in the sicutor. con or a conton; as have all the barenets of England, v to have borne the arms of the province of Uliter in Ireland.

AUGRI, or Awart, an infirument used by earpenters and joiners to bore large round holes; and confilling of a wooden handle, and an iron blade terminated at bottom with a fleel bit.

AUGSBURG, a city of Germany, capital of the circle of Saabia, feated near the confluence of the Ardech and Lech, in one of the most beautiful plains that can be imagined. It is one of the largelt and handsomed cities of the empire; but the fortifications are after the old manner, and very irregular; the firects are broad and ftraight; the houses mostly of timber plastered and whitened without, or adorned with paint ings; the reil are of free flone; the churches and four tains are generally ornamented with fine figures of heads. Many of the churches are stately, and adorned any with curious workman hip and paintings. The of the city erected by the noble family of the who are lords of the adjacent country, confident ral litects crofswife, containing 106 houless the people that inhabit them are maintained by pension. Its magnificent townbout to laide the to that of Amiterdam, it being a want douge Monte building, with a marble portico; at the son of front, within the pediment, is a large invent carrie, holding a sceptre and globe in its talous, of brake gilt, faid to weigh 2200 weight; the great portal is of a very beautiful reddish marble, over which is a beleony of the same colour, supported by two pillars of white marble; over the gate there are two large griffins of brafe; most of the rooms are wainfcotted and ceiled with very fine timbers the great hall is very magnifitent, and paved with marble; it is 140 feet long, 58 broad, and 52 high, and its roof is Supported by eight gentumns of red marble; the ceiling of the upper wall is Mery curious workmanship of polished ash, consisting on partments, the squares and pannels of which are entailed with gilded fculptures, and filled with pic-

tures and other ornaments: this is likewife supported Augsburgby eight pillars with bases and chapiters of brass: the other rooms are handfomely adorned with very fine paintings.

In the square, near the townhouse, is the fountain of Augustus, which is a marble bason, surrounded with iron balluftrades fuely wrought: at the four corners are four brafs statues as big as the life, two of which are women and two men; in the middle of the balon is a pedellal, at the foot of which are four large sphinxes Iquirting water out of their breads; a little above thefe are four infants holding four dolphins in their arms, which pour water out of their months; and over thefe infants are festoons and pine apples all of brass; upon the pedestal is the statue of Angustus as large as the the life. The fountam most remarkable next to this is that of Hercules, which is a hexagon bason with several brafe, figures, particularly Hercules engaging the hydra. Another curiotity is the fecret gate, which was contrived to let in persons safely in time of war: it has to many engines and divitions with gates and kerrs, and apartments for guards at fome distance from cach other, where pallengers are examined, that it is impossible for the town to be imprifed this way; the gates not belted and initiality, opened and flut, by unline experience, a forget plant tooks like enchantment. The way to be not allowery curious, of which there are times exist on a branch of the way. Lacky which sine through the sity an fuch a terrent as to design any bills, which may be a number of pumps that take the water to like a leader pipes to the tups of the towers, and the side leader pipes to the public foundations and there is the side water to the public foundations and there is no beginning to be a sold of the public foundations and the side water to the public foundations and the side water to the public foundations. The lateral water a college here, which is wift questionally the side water to the public to the foundation of the side of th

front by about there established and bay to which me arms. for the liberry of trading in the dry seemed with Gothic building. The cooling of which is faid to be the highest in Germany, and overlooks all the rell of the churches s it is adorned with feveral flatues, and has one very grand attar. The church of St Croix is one of the hand-fomed in Aughurg for architecture, painting, feulpture, gilding, and a fine fpire,

The inhabitants look upon Augustus Casar as the founder of the town; it is true that that emperor fent a colony there; but the town was already founded, though he gave it the name of Augusta Vindelicarum. Angiburg, indeed, is one of the oldest towns in Germany, and one of the most remarkable fithem, as it is there and at Nuremberg that you meet with the olded marks of German art and industry. In the 14th and 15th centuries, the commerce of this town was

Aughurg, the most extensive of any part of fouth Germany, and contributed much to the civilization of the country by the works of art and variety of necessaries to the comfort and convenience of life which it was the means of introducing. Many things originated in this town which have had a great influence on the happiness of mankind. Not to mention the many important diets of the empire held here; here, in 952, did a council confirm the order for the celibacy of priests; here, in 1530, was the confession of faith of the Protestants laid before the emperor and other estates of Germany; and here; in 1555, was figured the famous treaty of peace, by which religious liberty was fecured to Ger-

Though the Protoftants were very powerful at Augiburg, they could not keep then ground : for the Bavarians drove them from hence : but Gustavus Adolphus reflored them again in 1642; fince which time they have continued there, and fliare the government with the Catholics. In 1703, the elector of Bavaria mock the city after a fiege of feven days, and demolifhed the fortifications: however, the battle of Hochsted restorottineacous: nowever, the pattie of riochited genored their liberty, which they get enjoy under the government of their own magnification of histories, in
compared of persons of the state to bring
proofs of their nobility. The compared to bring
their own billion, what is allowed in the
figure manner as treest of the Compared belong. many manuer as trees of the Learnes belongs.

The police of the place is sery good translating the town has no territory, thus no detect. Amorting is, however, no longer and the translating than a trugger and we have the late the imperior millions. In this large, and have the trugger are no mercountry at the server of the greatest training the server are no mercountry at the server of the se of more used and state of const or and save set and committeers. State properties and a line seeking condition of the seeking condition and the seek towards and seeking seeki confined to the fmall religious works which are done elfewhere by Capuchin monks. They furnish all Germany with little pictures for prayer books, and to hang in the citizens houses. There is an academy of arts inflituted here under the protection of the magistrates: the principal aim of which is to produce good mechanics, and preserve the manufactures of the city.

This town, which is 95 miles in circumference, contains, according to Mr Riefbeck, hardly 30,000 inhabitants: but Mr Nicolai makes them about 35,000, and fays there are 28,000 houses.

This city as its drinking water from the river Lech, which runs at some distance from it: and the aqueducts which convey the water are much to be admired. As the court of Bavaria has it in its power to cut off this indif-

penfable necessary, by threatening the town with doing Augsburg io, it often lays it under contribution. But as it has, befides this, other means of keeping the high council in a state of dependance, to secure itself from this oppresfion, the city fecks the emperor's protection, upon whom it makes itself as dependant on the other fide. fo as to be indeed only a ball which both courts play with. The emperor's minister to the circle of Suabia generally refides here, and by fo doing fecures to his court a perpetual influence. There are always Austrian and Pruffian recruiting parties quartered here, and the partiality of the government to the former is very remarkable. In the war of 1756, the citizens were divided into equal parties for the two courts. The Catholics confidered the emperor as their god, and the Protestants did the same by the king of Prussa. The flame of religion had almost kindled a bloody civil waamongst them. The hishop takes his name from this town, but refides at Dillingen. He has an income of shout 20,000le per annum. As a proof of the cotholicitis of this place, the pope throughout his whole progress met nowhere with such honours as he don't here. This he owed to his friends the Jefuits, was have fill great influence. E. Long. 10, 58. N. Lat. 48. 24.

Augaburg Confession, denotes a celebrated confession of faith drawn up by Luther and Melancilion, on b. half of themselves and other ancient refermers, and presented in 1530 to the emperor Charles V. at the diet of Augulla or Augiburg, in the name of the evangelic body. This confession contains 28 chapter; of which the greatest part is employed in representing, with perspicuity and truth, the religious opinions of the Protestants, and the rest in pointing out the errare and abuses that occasioned their separation from the church of Rome.

AUGUR, an officer among the Romans appointed to foretel future events, by the chattering, flight, and eding of birds. There was a college or community of them, confifting originally of three members with respect to the three Lucires, Rhamnenfes, and Tatienfes; afterwards the number was increased to nine, four whom were patricians and five plebeians. They bo: " an augural staff or ward, as the enfign of their author were never depoted, nor any fublishment in their though they should be convicted of the most einipidie erimes. See Auguny.

AUGURAL, Comething relating to the augurs .-The surgaral inftruments are represented on several ancient medals.

that given by a prieft, on his fuft admission sute the order, called also by Varro Ady-

Mudurat Books, those wherein the discipline and rules of augury were laid down.

AUGURALE, the place in a camp where the general took auspicia. This answered to the Auguratorium in the city.

AUGURALS is also used in Seveca for the entign or badge of an augur, as the liteus.

AUGURATORIUM, a building on the Palatine mount, where public anguries were taken.

AUGURY, in its proper sense, the art of foretelling future events by observations taken from the 4 R 2 chattering, Stilling-

Lendar of

Acct's Ca-

Augury. chattering, finging, feeding, and flight, of birds; though it is used by some writers in a more general figuification, as comprifing all the different kinds of di-

> Augury was a very ancient superstition. We know from Hefiod, that husbandry was in part regulated by the coming or going of birds; and most probably it had been in use long before his time, as astronomy was then in its infancy. In process of time, these animals feem to have gained a greater and very wonderful authority, till at last no affair of consequence, either of private or public concern, was undertaken without confusing them. They were looked, upon as the interpreters of the gods; and those who were qualified to understand their oracles were held among the chief men in the Greek and Roman states, and became the affestors of kings, and even of Juniter himself. Howa ever abfurd fuch an inflitution as a college of august may appear in our eyes, yet, like all other extravagant inflitutions, it had in part its origin from mature. When men confidered the wonderful migration, of birds, how they disappeared at once, and appeared again at stated times, and could give no guesa where they went, it was almost natural to suppose, that they retired fomowhere out of the fphere of this earth, and perhaps approached the ethereal regions, where they night converse with the gods, and thence be enabled to predict events. It was almost natural for a superflatious people to imagine this; at least to believe it, as foon as tome impostor was impudent enough to affert it. Add to this, that the disposition in some birds to imitate the human voice, must contribute much to the confirmation of fuch a doctrine. This inflitution of augury feems to have been much more ancient than that of arufpicy; for we find many inflances of the former in Homer, but not a fingle one of the latter, the frequent mention is made of facrifices in that author. From the whole of what has been observed, it seems probable that natural augury gave rife to religious must gury, and this to aruspicy, as the mind of man makes a very easy transition from a little truth to a great deal? of ciror.

A passage in Aristophanes gave the hint for their observations. In the Comedy of the Birds, he makes one of them fay this: 'The greatest bleflings wh can happen to you, mortals, are derived from 161 We show you the seasons, viz. Spring, Winter tumn. The crane points out the time for lewing when she slies with her warning notes into Eyrphy he buls the failor hang up his rudder and take his red and every prudent man provide himself sink and garments. Next the kite appearing, practical and the teafon, viz. when it is time to their the flame. that the fwallow informs you when it is time to put on tummer clothes. We are to you (adds the chorus). Ammon, Dodona, Apollo: for, after confulting us. you undertake every thing I merchandife, purchases, marriages,' &c. Now, it frems not improbable, that the same transition was made in the speculations of men which appears in the poet's words; and that they were easily induced to think, that the surprising forefight of birds, as to the time of migration, indicated fomething of a divine nature in them; which opinion Virgil, as an Epicurean, thinks fit to enter his protest agains, when he lays,

Hand equidem credo, quia fit divinitas illis

But to return to Aristophanes. The first part of the chorus, from whence the fore-cited passage is taken, feems, with all its wildness, to contain the fabulous cant, which the augurs made use of in order to account for their impudent impositions on mankind. It fets out with a cosmogony; and fays, That in the beginning were Chaos and Night, and Erebus and Tartarus: That there was neither water, nor air, nor fley: That Night laid an egg, from whence, after a time, Love arose: That Love, in conjunction with Erebus, produced a third kind; and that they were the first of the immortal race, &c.

AUGUST (Augustus), in a general fense, something majestic, venerable, or facred. The appellation was first conferred by the Roman senate upon Octavius, after his being confirmed by them in the fovereign power. It was conceived as expressing something divine, or elevated above the pitch of mankind, being derived from the verb augeo, "I increase," tanguam fupra bumanam fortem austus. See Augustus.

August, in chronology, the eighth month of our year, consisting 31 days. Angust was dedicated to the language of angustus Language, because, in the same months at the created angustus. There eximpled in Roma fandual Legist in the Roman empire, and made an and of bird event, being before called families.

AUGUSTIN, or Ave bilbop at Cinterbury, we convent of St Andrew at B St Gregory afterward by was despotential into lish Gamma to Che contain the Decemperation of the case of t was extremely picated at their become sever attempted to compel them. The despatched priest and a monk to Rome, to acquain the story the fuerels of his million, and to delice his of certain questions. These men brought mich with them a pall, and leveral books, veliments, utenfils, and ornaments for the churches. His boline's, by the fame meffengers, gave Augustin directions concerning the fettling of episcopal sees in Britain; and ordered him not to pall down the idol temples, but to convert them into Christian churches; only dettroying the idols, and fprinkling the place with holy water, that the natives, by frequenting the temples they had been always accultomed to, might be the less shocked at their entrance into Christianity. Augustin resided principally at Canserbury, which thus became the metropolitan church of England; and having established bishops in several of the cities, he died on the 26th of May 607. Popish writers ascribe several miracles to him. The ablervation of the festival of St Augustin was suft onjoined in a fynod held under Cuthbert archbishop of Augustia. Canterbury, and afterwards by the pope's bull in the

reign of King Edward III.

AUGUSTINE (St), an illustrious father of the church, was born at Thagaste, a city of Numidia, on the 13th of November 354. His father, a burgels of that city, was called Patricius; and his mother, Monica, who being a woman of great virtue, influcted him in the principles of the Christian religion. In his early youth he was in the rank of the catechumen. and falling dangeroully ill, earneftly defired to be baptized; but the violence of the distemper ceasing, his baptifm was delayed. His father, who was not yet baptized, made him fludy at Thagefte, Madaura, and afterwards at Carthage. Augustine having read Cicero's books of philolophy, began to entertain a love for wildow, and applied himfelf to the fludy of the holy scriptures; nevertheless, he suffered himself to he feduced by the Manicheans. At the age of 19, he seturned to Thagaste, and taught grammar, and allo frequented the bar: he afterwards taught rhetoric at Carthage with applaufe. The infolence of the scholars at Carthage made him take a resolution to go to: Rome, though against his mother's will. Here also he had many scholars; but disliking them, he quitted Rome, and fettled at Milan, and was chosen public professor of rhetoric in that city. Here he had opportunities of hearing the fermons of St Ambrofe, which, together with the fludy of St Paul's epiftles, and the convertion of two of his friends, determined him to retract his errors, and quit the feet of the Manicheans: blis was in the 32d year of his age. In the vacation of the year 386, he retired to the house of a friend of his. named Vercendus, where he feriously applied himself to the Rudy of the Christian religion, in order to prepure himself for baptism, which he received at Lailer in the year 387. Soon after this, his mother came to fre him at Milan, and invite him back to Carthage; but Oftia, whither he went to embark in order to him turn, the died. He arrived in Africa about the end of the year 388; and having obtained a garden plot without the walls of the city of Hippo, he affociated handle with is other persons of emineut fanctity, who diffinguished themselves by wearing leathern guidles, and wed there in a monastic way for the space of three react elercing themselves in satting, prayer, study, up the Augustine friars, or eremites of St Augustine, being the fielt order of mendicants; those of St Jerome, the Carthelius and others, being but branches of this of Alignstine. About this time, or before, Valentia belook against his will, ordained him parts according to reside in his little modestery, with his brethren, who, renounting all property, possessed their goods in common. Valerius, who appointed St Augustine to preach in his place, allowed him to do it in his preferee, contrary to the custom of the churches in Africa. He explained the creed, in a general council of Africa, held in 393. Two years after, Valerius, fearing that he might be preferred to be bishop of another church, appointed him his coadjutor or colleague, and caused him to be ordained bishop of Hippo, by Megalus bishop of Calame, then primate of Numidia. St Augustine died the 28th day of August 430, aged 76 years, having had the misfortune to fee his country invaded by the Vandels.

No one composed with greater facility than Avice-Avcenia. nes, writing, when he fat down to it, 50 pages generally in a day, without fatiguing himself. The doctors of Chiras, having made a collection of objections against one of his metaphysical works, sent it to him at Ispahan by Casem. This learned man, not arriving till towards evening, came to Avicenes's house, with whom he fat discoursing till midnight. When Casem was retired, he wrote an answer to the objections of the Chirazians, and finished it before funrife. He immediately delivered it to Casem, telling him, that he had made all possible despatch in order not to detain him any longer at Ispahan.

Avicenes, after his death, enjoyed to great a reputation, that till the 12th century he was preferred for the fludy of philosophy and medicine to all his predecellors. His works were the only writings in vogue in schools, even in Europe. The following are the tilles: 1. Of the Utility and Advantage of Sciences, XX books. 2. Of Innocence and Criminality, II books. 3. Of Health and Remedies, XVIII books. 4. On the means of preferving Health, III books, 3. Canons of Phylic, XIV books. 6. On Aftronomical Observations, I book. 7. On Mathematical Sciences. 8. Of Theorems, or Mathematical and Theological Demonstrations, I book. 9. On the Arabic Language, and its Proprietics, X books. 10. On the Last Judgment. 11. On the Origin of the Soul, and the Resurrection of Bodies. 12. Of the end we should propose to ourselves in Harangues and Philo-Sophical Argumentations. 13. Demonstration of the collateral Lines in the Sphere. 14. Abridgement of Euclid. 15. On Finity and Infinity. 16. On Thy-fics and Metaphysics. 17. On Animals and Vegeta-bles, &c. 18. Encyclopedic, 20 volumes.—Some, however, charge him with having flolen what he published from a celebrated physician who had been his master. This man had acquired so much honour and wealth, that he was folicited by many to take the fons to be his scholars, or even his servants; but ing resolved not to discover the secrets of his art, his would receive none of them. Avicenes's mother formed the following stratagem: She offered him her die as a fervant, pretending he was naturally dear and limbs and the youth, by his mother's instructions, county feited those defects so well, that the phylician, when making several trials to discover the reality of them. took the boy into his fervice, and by degrees transmit him fo far as to leave his writings open in his recent when he went abroad : A vicenes took that opportunity to transcribe them, and carried the point to his an ther; and after the death of his maliter he multipled them under his own name. Indeed if we reach that he lived but 38 years, that he was a wanderer and a fugitive, and that he was much addicted to his pleafures, we shall have some difficulty to conceive how he could find time to compole to many works. Physic, however, is indebted to him for the discovery of casha, rhubarb, mirabolans, tamarinds; and from him alfo, it is faid, came to us the art of making Ingar.

AVICENIA, EASTERN ANACARDIUM: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, Personate. The calyx is quinquepartite; the corolla is bilabiated, the upper lip squared; the capfule is leathery, romb-like, and monosper- Avigate mous. There are two species; the tomentosa or downy, and the nitida or thining. The feeds of the first are faid to be the Malacca beaus formerly kept in the shops (though this is doubtful), the kernels of which were eaten as almonds. The plants producing the Malacca bean, as it is called, is rather thought to be the BONTIA Germinans.

AVIGATO PEAR. See LAURUS.

AVIGLIANO, a small town of Piedmont in Italy. E. Long. 7. 5. N. I.at. 44. 40.

AVIGNON, a city of Provence in France, the capital of the county of Venaissin, and seated on the banks of the Rhone. It is an archbishop's see, and the refidence of feveral popes at this place for 70 years has rendered it confiderable. It still belongs and is . subject to the pope, who sends a vice-legate every three years, who in some sense is the governor : and Mr Bwittburne is of opinion the ecclefiattical government here is more for the benefit of the people than If they were subject to the king of France. Near the Rhone there is a large rock, within the circumference of the walls, upon which is a platform, from whence may be had a prelipted of the whole city and the places about it. The sky described the whole city and the places about it. The sky described the preparation of the sky general ill built, irregion and to the sky described by handlone in the particle walls and torrete not inside those at those and its manner relifices are large, sould not a proper and a quantic relifices at large could not a proper and an appearance of the sky described the sky described to of the walls, upon which is a platform, from whence Laure and orpolite is the special control of the control of the control of the special con

The charge of Notic Dane is motent, but not large and is one of the bell adorned in the city. After have ged about 50 fleps, you come to a very antheir portice, which fultains a great tower ; as you enver the church on the left hand, you for paintings which equal the finest in Italy. The great altar is very magnificent, and is adorned with a fhrine that contains the relics of we know not how many faints. The treafure of the facrifty is worthy of the curiofity of the traveller. The little palace where the archbishop refides is formed of three bodies of lodgings, accompamed with courts and small pavilions. It overlooks the Rhone, the city, and the fields. These buildings and the mint adorn a large square, which is the common walk of the inhabitants.

In Avignon they reckon feven gates, feven palaces, feven colleges, seven hospitals, seven monasteries, feven numeries, and feven popes who have lived there Avignon, in 70 years. The steeples are numerous, and the bells are never at reft; one of filver is rung only on the death of a pope. The church of the Celestines is very magnificent, and full of fine monuments, and the rest are not without their curiofities. The university has four colleges; and the place where the Jews live is a diffinct quarter, from whence the Jews who pay tribute dare not flir out without yellow hats, and the women must have fomething yellow about their heads, to diffinguish them from the Christians. Their number is very confiderable in a very confined place, where the only way of enlarging their abodes is by building their houses higher. Their fynagogue is so dark, that they are obliged to light lamps. However, they are forced to hear a monk preach a fermon every week. Acrofs the Rhone, here, extend the ruinous and decayed arches of that bridge against which Madame de Grignan was fo near being loft, and of which Madame de Stvigné makes terrificil mention. It was demolished in 1699 by one of the inundations common to the Rhone. When entire, it was not less than a quarter of a mile in length; but being so narrow as not topermit two carriages to pale in any part, it had previously become almost utcless, and motives of voltage prevent the confluencies of confluence with the confluence of the part of the confluence of the part of the confluence of vents any weight from de depth. Though the tolintary as, classes, crystal, yet the incusabent rack calls a per approaching to black, over its furface. The water clean. ing from this state of inaction by a narrow pellage, is immediately precipitated in a calcade down a rocky channel, where it foams over a number of vast detached stones, which intercept and impede its progress. They are covered with a deep green moss of many ages, and have probably tumbled from the mountains that overhang the torrent. The rocks themselves, which furround and invest this romantic spot, are worn by time and the inclemency of the weather into a thousand extraordinary and fautastic forms, to which imagination gives shape and figure. On one of the pointed extremities, and in a fituation which appears almost inacceffible, are seen the remains of an ancient catile, projecting over the water. The peafants call it Il Castello

Vol. II. Part II.

di Petrarca; and add, with great simplicity, that Avignos Laura lived upon the opposite side of the river, under the bed of which was a fubterranean passage by which the two lovers vifited each other. Nothing is however more certain, than that these are the ruins of the chateau belonging to the lords or feigneurs of Avignon; and the bishop of Cavaillon resided in it during the frequent vifits which he used to make to Petrarch .--'The poet's dwelling was much lower down, and nearer to the hank of the Sorgues, as evidently appears from his minute description of it, and the relation he gives of his quarrel with the Naiads of the stream, who encroached during the winter on his little adjoining territory. No remains of it are now to be differenced. Below the bridge there is an island where the Sorgues joins the Rhoue, in which are feveral houses of plea-dure. E. Long. 4. 50. N. Lat. 43. 57.

growing plentifully near Avignon and in other parts of France. The berry is somewhat less than a pea; its colour is green, approaching towards a yellow; and it is of an astringent and bitter taste. - It is much used by the dyers, who stain a yellow colour with it; and by the painters, who also make a fine golden yel-

low of it.

AVILA, a city of Old Castile, in Spain, Seated on an eminence on the banks of the river Adaja, and in light of the mountains of Pico. It is fortified both by nature and art, having a wall 9075 feet in circum brence, adorned with 26 lofty towers, and 10 handgates. There are 17 principal streets, the house in relica are generally good, and fome of them stately. It hath mae squares, 2000 houses, nine parishes, as many ingualteries, feven nunneries, two colleges, nine hoipitals, 18 chapels, and an allowance of 10,000 duen's gearly for the maintenance of orphans and other poor people. It has an university, and a confiderable beshopric; besides a noble cathedral, which has eight die itaries, 20 canons, and the lame number of minor sains. It flands in the middle of a fine large plan. corresponded with mountains, and covered with feur trees and vineyards. There is likewife a manufacture of clothe: W. Long. 4. 13. N. Lat. 40. 35.

AVIS a small town of Alentejo in Portugal, feat 4 an eminence, with a castle near the river Avis. Hee ...

W. Long, 7. o. N. Lat. 38. 40.

Angle of Avis), an order of knighthood in the standard established about the year 1162. When the transition of the standard established about the Moors, in the reign irth sing of Portugal, it was garrifound by fewhich was foon after changed for that of knights d'Aria, which the king gave them, and whither they removed from Evora. The badge of the order is a green crofs flory, and they observe the rule of St Benedict.

AVISO, a term chiefly used in matters of commerce to denote an advertisement, an advice, or piece

of intelligence.

AVISON (Charles), organist of Newcastle, and a disciple of Geminiani, was the author of an csiay on mufical expression, published in the year 1752, in which are some judicious reslections on music in general, but his division of the modern authors into chises is rather

Anlie

Aunger-

vyle.

fanciful than just. Throughout his book he celebrates Marcello and Geminiani; the latter frequently in prejudice to Mr Handel. In the year 1753 came out remarks on Mr Avison's essay on musical expression, the author whereof first points out fundry errors against the rules of composition in the works of Avison. In the same year Avison republished his essay, with a reply to the author of the remarks; and a letter, containing a number of loofe particulars relating to music collected in a course of various reading, unquestionably written by Dr Jortin. Avison promoted and affisted in the publication of Marcello's music to the pfalms adapted to English words. Of his own composition there are extant five collections of concertos for violins, 44 in number; and two fets of fonatas for the harpfichord and two violins, a species of composition little known in England till his time. The music of Avison is light and elegant, but it wants originality i. a necessary consequence of his too close attachment to . the ftyle of Geminiani, which in a few particulars only he was able to imitate.

See ALGA. AUK, in ornithology.

BISHOP'S AUKLAND, a town of the bishopric of Durham in England, fituated on the river Were. It is a fanctuary for debtors; and here the bishop has a princely palace and a noble park. W. Long. 0, 57. N. Lat. 54. 44.

AULA, is used for a court baron by Spelman; by fome old eccletiastical writers, for the nave of a church,

and fometimes for a court yard.

Auga Regia, or Regis, a court chablished by William the Conqueror in his own hall, composed of the king's great officers of state, who resided in his palace, and were usually attendant on his person. This court was regulated by the article which forms the eleventh. chapter of Magna Charta, and established in Westminder hall, where it hath ever fince continued. King's BENCH.

AULCESTER, a town of Warwickshire in Engain

land. W. Long. 1. 47. N. Lat. 52, 15.

AULETES, in antiquity, denotes a flute-players One of the Ptolemies, kings of Egypt, father of Clears patra, bore the furname or denomination of Auleior.

AULIC, an epithet given to certain officers of the empire, who compole a court which decides, without appeal, in all processes entered in it. Thus we live aulic council, aulic chamber, aulic counfellar.

The aulic council is composed of a president, who is a catholic; of a vice chancellor, preferred by the archbishop of Ments; and of 18 counsellors, nice of whom are Protestants and nine Catholies .. They divided into a bench of lawyers, and siways follow the emperor's court; for which reason they are called jucouncil. The sulic court ceales at the death of the amperor; whereas the imperial chamber of Spire is perpetual, reprefenting not only the deceafed emperor, but the whole Germanic body, which is reputed never to die.

Aulic, in the Sorbonne and foreign universities, is an act which a young divine maintains upon being admitted a doctor in divinity. It begins by an harangue of the chancellor, addressed to the young doctor, after which be receives the cap, and prefides at the aulic,

AULIS (anc. geog.), a town of Boretia, over against Chalcis of Eubera, on the Euripus, where that strait is narrowell; and which were sometimes joined together by a mole or causeway, (Diodorus Siculus): a craggy fituation, (Homer, Nonnius); and a village of the Tanagræi, (Strabo), distant from Chalcis three miles: A harbour famous for the rendezvous of a thoufand ships under Agamemnon, previous to the Trojan expedition, (Livy, Virgil, Pliny.) Now entirely destroyed.

AULNEGER. See Alnager.

AULON, anciently a town and dock or station for ships in Illyricum, on the Adriatic; now Valona, or Volana, a port town in the duchy of Ferrara, on one of the mouths of the Po, on the gulf of Venice. E. Long. 13. N. Lat. 44. 50.

Auton, or Aulona, anciently a town of Elia, in Peloponnesus, on the confines of Messenia. Here flood, a temple of Æsculapius; hence the epithet An-

Tomins given that divinity, (Paufanias). AULOS, a Grecian long measure, the same with

AULPS, a town of Provence in France, in the diocele of Frein, with a title of a vigurie. AULUS PRESENTA SE OFERINA AULUS PRESENTA SE OFERINA AUMERICA COMPANY SEPRESENTA

ward prison of Water, afterward king adjusted 11. Upon the incession of his royal graph to the thums he was lift appointed cofferer, their treasurer of the ward-robe; archideacouser Northampton, prebendary of Line. coin, Serum, and Litchfield, heeper of the privy feat, dean of Wells, and last of all was promoted to the bi-Goprick of Durham. He likewife enjoyed the offices. of lord high chancellor, and treasurer of England a and: discharged two important embassies at the court of France. Learned himself, and a patron of the learned, he maintained a correspondence with some of the greatest geniuses of the age, particularly with the celebrated Italian poet Petrarch. He was also of a most humane and benevolent temper, and performed many fignal acts of charity. Every week he made eight quarters of wheat into bread, and gave it to the poor. Whenever he travelled between Durham and Newcastle, he distributed eight pounds sterling in alms; between Durham and Stockton five pounds, between Durham and Aukland five marks, and between Durham and Middleham

Middleham five pounds. He founded a public library at Oxford, for the use of the students, which he furnished with the best collection of books then in England; and appointed five keepers, to whom he granted yearly falaries. At the dissolution of religious houses in the reign of Henry VIII. Durham college, where he fixed the library, being diffolved among the rest, some of the books were removed to the public library, some to Baliol college, and fome came into the hands of Dr George Owen, a physician of Godstow, who bought that college of King Edward VI. Bishop Aungervyle died at his manor of Aukland, April 24. 1345, and was buried in the fouth part of the cross sife of the cathedral church of Durham, to which he had been a bemefactor. He wrote, 1. Philobiblos, containing directions for the management of his library at Oxford, and a great deal in praise of learning, in bad Latin. 2. Epillula familiarium; fome of which are written to the famous Petrarch. 3. Orationes ad principes; mentioned by Bale and Pitts.

AUNIS, the smallest province in France, bounded on the north by Poictou, on the west by the occas, on the east and south by Saintogno, of which it was formerly a part. It is watered by the rivers from and Charente, the former of half he is followed at Scarce in Poictou. The saint was all the first of the saint was a saint of the saint was a saint of the saint of the

harder and coarder commodities, luth as protected, stated was protected, stated was protected, and the second paration towns, are to make their bread by avoiding the second point in the second point with the second point with the second proportion of a pound avoirdupois to a pound troy; is as 17 to 14.

AVOSETTA, in ornithology. See RECURVIAGE

AVOWEE, one who has a right to present to a benefice. He is thus called in contradistinction to those who only have the lands to which the advowson belongs for a term of years, or by virtue of intrusion or difficisin.

AVOWRY, in law, is where a person distrained sues out a replevin; for then the distrainer must vow, and justify his plea, which is called his account.

"AURA, among physiologists, an airy exhalation

or vapour. The word is Latin, derived from the Greek, Aurach aven, gentle wind.

AURACH, a town of Germany with a good castle, in the fouth part of Suabia, in the duchy of Wirtemberg. It is the usual residence of the youngest sons of the house of Wirtemberg, and is seated at the foot of a mountain on the rivulet Ermst. E. Long. 9. 20. N. Lat. 48. 25.

AURAE, in mythology, a name given by the Romans to the nymphs of the air. They are mostly to be found in the ancient paintings of ceilings; where they are represented as light and airy, generally with long robes and flying veils of some lively colour or other, and fluttering about in the rare and pleasing element assigned to them. They are characterized as sportive and happy in themselves, and wellwishers to

mankind. AURANCHES, the capital of a territory called Auranchia, about 30 miles in length, in Lower Normandy in France. The city is mean; but its fituation very fine, being on an eminence, near which the river See runs, about a mile and a half from the ocean. The cathedial flands on a hill, which terminates abruptly; the front of the church extending to the extreme verge of it, and overhanging the precipice. It bears the marks of high antiquity; but the towers are decayed in many places, though its original construction has been wonderfully, strong. Here, you are told, the English Henry II. received absolution from the Papal memorio for the murder of St Thomas-a-Becket in 1172; the flone on which he knelt during the performabor of that ceremony is shown to strangers. Its length is about 30 inches, and the breadth 12. It stands before the north portal, and on it is engraved a chalice in commemoration of the event .- The ruins of the castle of Attraches are very extensive; and beneath lies a rich extent of country, abounding in grain and covered with archards, from the fruit of which is made the best cyder in Normandy. W. Long. 1. 20. N. Lat. 48. 51.

AURANTIUM, in botany. See CITRUS.
RURAY, a small seaport town of Lower Brittany
in France, situated in the gulf called Morlishan. It
is nothing, properly speaking, but a large quay, and
himasome street, being chiefly known for its trade.
Long. 2. 25. N. Lat. 47. 48.

AURELIA, in natural history, the same with what a more usually called chrysalis, and sometimes nymph.

AURELIANUS (Lucius Domitius), emperor of Rome, was one of the greatest generals of antiquity, and commanded the armics of the emperor Claudius with theh garry that after the death of that emperor the legions agreed to place him on the throne: this happened in the year 270. He carried the war from the east to the west, with as much facility, says a modern writer, as a body of troops marches from Alface into Flanders. He defeated the Goths, Sarmatians, Marcomanni, the Perlians, Egyptians, and Vandals; conquered Zenobia queen of the Palmyrenians, and Tetricus general of the Gauls; both of whom were made to grace his triumph, in the year 274. He was killed by one of his generals in Thrace in the year 275, when he was preparing to enter Persia with a great army. See ROME.

AURELIUS victor. See Victor.

4 S 2 AURENGABAD,

Aurora

Aurengahad Aurillac.

AURENGABAD, a city in the East Indies, capital of the province of Balagate, in the dominions of the Great Mogul. It is furnished with handsome mosques and caravanferas. The buildings are chiefly of free stone, and pretty high, and the streets planted on each fide with trees. They have large gardens well stocked with fruit trees and vines. The foil about it is also very fertile, and the sheep fed it its neighbourhood are remarkably large and ftrong. E. Long. 75. 30. N. Lat. 10. 10.

AURENG-ZEBE, the Great Mogul. See Indo-

AUREOLA, in its original fignification, fignifies a jewel, which is propoled as a reward of victory in a fome public dispute. Hence the Roman schoolmen applied it to denote the reward bellowed on martyrs. virgins, and doctors, on account of their works of inpercrogation; and painters use it to fignify the crown of glory with which they adorn the heads of faints, confessors, &c.

AUREUS, a Roman gold coin, equal in value to 25 denarii.—According to Ainfworth, the sureus of the higher empire weighed near five pennyweights; and in the lower empire, little more than half that weight. We learn from Suctonius, that it was cultur ary to give aurei to the victors in the chariot races.

AUREUS MONS (anc. geog.), a mountain in the north-well of Corlica, whole ridge runs out to the north-east and south-east, forming an elbow .- Another at mountain of Mecha Superior, or Servia (Pentinger), de lier in the service of to the fouth of the Danube, with a cognominal town at its foot on the same river. The emperor Probus, or the planted this mountain with vines (Eutropius).

AURICK, a city of Germany; in East Friesland, in the circle of Wellphalia; to which the king of Profile claims a right. It is fituated in a plain forrounded with forests full of game. E. Long. 6. 50. N. Lat. 53. 28.

AURICLE, in anatomy, that part of the ear which is prominent from the head, called by many authors auris externa.

Augicurs are likewise two muscular bags situated at the basis of the heart, and intended as diverticula for the blood during the diaftole.

AURICULA, in botany. See PRIMULA. AURIFLAMMA, in the French history, property denotes a flag or flandard belonging to the abbey of Dennis, suspended over the tomb of that faint, which a the religious, on occasion of any war in defence of their lands or rights, took down, with great ceremony, and gave it to their protector or advocate, to be home at

the head of their forces. Auriflamma is also sometimes used to denote the chief flag or flandard in any army, "......"

AURIGA, the Waggonse, in altronous, a constellation of the northern hemisphere, consisting of 23 flars, according to Tycho; 40 secording to Hevelius; and 68, in the Britannic catalogue.

AURILLAC, a town of France in the Lower Auvergne, seated final river called Jordane. It is one of the most derable towns of the province, has fix gates, is very high, and yet has but one parish, The castle is very high, and commands the town. The abbot is lord Aurillac, and has episcopal jurisdic-

tion; he is also chief justice of the town. This place Auripigis remarkable for having produced several great men. mentum E. Long. 2. 33. N. Lat. 44. 55.

AURIPICMENTUM, ORPIMENT, in natural hi- Borcalla. flory. See Orpiment.

AURISCAPIUM, an inflrument to clean the ears, and ferving also for other operations in disorders of that part.

AURORA, the morning twilight, or that faint light which appears in the morning when the fun is within 18 degrees of the horizon.

AURORA, the goddess of the morning, according to the Pagan mythology. She was the daughter of Hyperion and Theia, according to Hefiod; but of Titan and Terra, according to others. It was under this name that the ancients deined the light which foreruns the riling of the fun above our hemilphere. The poets represent her as rifing out of the ocean, in a chariot, with rofy fingers dropping gentle dew. Virgil describes her afcending in a flame-coloured chariot with four

horfes. Augora, one of the New Hebrides islands in the South fen in which Mr Fofter supposes the Peak d' Etoile mentioned by Mr. Bougainville to be fit nated. The island is inhabited, but none of designabitants came off to villa Captant Chapt. The descript woody, and the vegetation feiting to the excellent innament. It is about 12 length long but not about the midthern part of and in it ufmalling flowing and continuously different factors, the ring the colours from which times of pullbridge the chicago an fet. They often cover the neotic hemilians as then make the med brilliant appearance. Their me tions at them times are most amazingly quick; and they aftonish the spectator with the rapid change of their form. They break out in places where none were feen before, ikimming brilkly along the beavens; are fuddenly extinguished, and leave behind an uniform dulky tract. This again is brilliantly illuminated in the fame manuer, and as fuddenly left a dull blank. In certain nights they assume the appearance of vast columns, on one fide of the deepest yellow, on the other declining away till it becomes undiffinguished from the fky. They have generally a ftrong tremulous motion from end to end, which continues till the whole vanishes. In a word, we, who only see the extremities of these northern phenomena, have but a faint

Aurera idea of their fplendour and their motions. According Borealis, to the state of the atmosphere, they differ in colours. They often put on the colour of blood, and make a most dreadful appearance. The rustic sages become prophetic, and terrify the gazing speciators with the dread of war, pettilence, and famine. This superflition was not occuliar to the northern islands; nor are these appearances of recent date. The aucients called them Chasmata and Trabes, and Bolides, according to their forms or colours.

> In old times they were extremely rare, and on that account were the more taken notice of. From the days of Plutarch to those of our fage historian Sir Richard Baker, they were supposed to have been portentous of great events, and timid imagination shaped them into aerial conflicts:

Fierce fiery warriors fight upon the clouds In ranks and foundrons and right form of war,

This mete-

D. I lalley tells us, that when he faw a great aproor fermerly ra borea's in 1716, he had begun to despair of ever very rare. feeing one at all; none having appeared, at leaft in any confiderable degree, from the time he was born till then. Notwithstanding this long interval, howevery it feems that in some periods the aurora porealis had been seen much more recomment i and periods this, as well as other astural phenomena, and have some stated

times of setupooling.

The coal's thing that parenthes a difficult inflory of Di Halley that phenomicon, is sent to some transfer account he Flatter. Phil. Tenne W. a.c. Was size account he piece to get the account the piece. reprint the property of Language to the particle of the partic ipears, serviced cities, and armies lighting in the air. After this, Mirhael Meetlin, tutor to the great Leplen. affurer us, that at Bakhang in the county of berg in Germany, these phenomena, which the dyler shalmate, were feen by himself no less than feven times in 1580. In 1581, they again appeared in an extraordinary manner in April and September, and in a lefs degree at some other times of the same year. In 1621, September 2. this phenomenon was observed all over France, and described by Gassendus, who gave it the name of aurora burealis: yet neither this, nor any fimilar appearances posterior to 1574, are described by English writers till the year 1707: which as Dr Halley observes, shows the prodigious neglect of curious matters which at that time prevailed. From 1621 to 1707, indeed, there is no mention made of an aurora Lorealis being feen by any body: and confidering the number of astronomers who during that period were in a manner continually poring on the heavens, we may

very reasonably conclude that no such thing did make Aurora its appearance till after an interval of 86 years. In Borealis. 1707, a small one was seen in November; and danny that year and the next, the fame appearances were repeated five times. The next on record is that mentioned by Dr Halley in March 1715-16, the brilliancy of which attracted universal attention, and by the vulgar was confidered as marking the introduction of a foreign race of princes. Since that time those meteors have been fo common, that no accounts have been kept of them.

It was for a long time a matter of doubt whether Mr Ferthis meteor made its appearance only in the northern ther's achemisphere, or whether it was also to be observed near count of si the fouth pole. This is now afcertained by Mr For-perances fter, who in his late voyage round the world along in the with Captain Cook, affures us, that he observed them southern in the high fouthern latitudes, though with phenome-homena timewhat different from those that are seen here. There . On Feb. 17. 1773, as they were in Lat. 58° fouth, 44 A: beautiful phenomenon (lays he) was observed during the preceding night, which appeared again this and feveral following nights. It confided of long columns of a clear white light, shooting up from the horizon to the castward, almost to the zenith, and gradually spreading to the whole fouthern part of the fav. These columns were sometimes bent sidewise at their upper extremities; and though in most respects similar to the northern lights (amora boreelis) of our hemi-Sphere, yet differed from them in being always of a whitith colour, whereas ours assume various tints, especialby those of a fiery and purple hue. The fky was generally clear when they appeared, and the air fliarp and cold, the thermometer flanding at the freezing point."

Dr Halley observed that the aurora borealis describ-Rifes very ed by him arose to a prodigious height, it being feen high. from the west of Ireland to the confines of Russia and Poland on the east; nor did he know how much further it might have been visible; so that it extended at least 30 degrees in longitude, and from lat 50° north it was keep over all the northern part of Europe; and what was very furprifing, in all those places where it was vifible; the fame appearances were exhibited which I). Halley observed at London. He observes, with feeming regret, that he sould by no means determine its beight, for want of observations made at different placontribution he might as callly have calculated the height of this aurora borealis, as he did of the hery globe in 1719 To other, philosophers however, he Seculigiven the following exhortation: "When therefore there for the future any fuch thing shall happen, all those that are curious in aftronomical matters are hereby admonifhed and entreated to let their clocks to the apparent time at London, for example, by allowing for many minutes as is the difference of meridians; and then to note at the end of every half hour precifely, the exact fituation of what at that time appears remarkable in the fky; and particularly the azimuths of those very tall pyramids to eminent above the reft, and therefore likely to be feen furthest: to the intent that, by comparing these observations taken at the same moment in diffrant places, the difference of their azimuths may ferve to determine how far these pyramids are distant from us." This advice of Dr Halley feems to have been totally neglected by all the philosophical people in his country. In other countries, however, they

Acrors have been more industrious. Father Boscovich has Borealis. determined the height of an aurora borealis, observed on the 16th of December 1737 by the marquis of Poleni, to have been 825 miles high; the celebrated Mr Bergman, from a mean of 30 computations, makes the average height of the aurora borealis to be 70 Swedish, or upwards of 460 English miles. Euler supposes it to be several thousands of miles high; and Mairan also assigns them a very elevated region. In the 74th volume of the Philosophical Transactions, Dr Blagden, when speaking of the height of some siery meteors, tells us, that the "aurora borealis appears to occupy as high, if not a higher region above the furface of the earth, as may be judged from the very diffant countries to which it has been visible at the fame time." The height of thefe meteors, however, none of which appear to have exceeded or even arrived at the height of a hundred miles, must appear triffing in comparison of the vast elevations above mentioned. But thefe enormous heights, varying fo exceedingly, show that the calculators have not had proper data to proceed upon; and indeed the immense extent of space occupied by the surora borealis itself, with its constant motion, must make it infinitely more difficult to determine the height of it than of a fiery globe, which occupies but a fmall portion of the visible heavens. The most certain method of making a comparison betwixt the aurora borealis and the meteors already mentioned, would be, if a ball of fire should happen to pais through the same part of the heavens where an aurora borealis was; when the comparative height of both could eafily be afcertained. One instance of this only has come under our observation, where one of the small meteors, called falling stars, was evidently obscured by an aurora borealis; and therefore must have been higher than the lower part of the latter at least. A fingularity in this meteor was, that it did not proceed in a straight line through the heavens, as is usual with falling flars, but described a very confiderable arch of a circle, rifing in the northwest. and proceeding fouthward a couliderable way in the arch of a circle, and disappearing in the north. Its silges were ill defined, and five or fix corrufcations feemed to: issue from it like the rays painted as issuing from state. The aurora borealis was not in motion, but had degenerated into a crepulculum in the northern part of the hemisphere. Indeed in some cases this kind of cremisculum appears to plainly to be connected with the clouds, that we can scarcely avoid supposing it to proceed from them. We cannot, however, argue from this to the height of the aurora boreaks when it moves, with great velocity, because it then may, and very probably does, afcend much higher. Dr. Blagden, indeed, informs us, that inflances are recorded, where the northern lights have been feen to join, and form luminous balls, darting about with great velocity, and even leaving a train like the common fire-balls. It' would feet therefore, that the highest regions of the au-rora boress are the same with those in which fire-balls move.

Conjectures With regard to the cause of the aurora borealis, concerning many conjectures have been formed. The first which the cause of naturally surfarred was, that it was occasioned by the ascent of the mable sulphureous vapours from the earth. Tupposition Dr Halley objects the immenfe extent of fuch phenomena, and that they are Aurora constantly observed to proceed from north to fouth. Boreslis. but never from fouth to north. This made him very reasonably conclude, that there was some connexion between the poles of the earth and the aurora borealis; but being unacquainted with the electric power, he fupposed, that this earth was hollow, having within it a magnetical sphere, which corresponded in virtue with all the natural and artificial magnets on the furface: and the magnetic effluvia passing through the earth. from one pole of the central magnet to another, might fometimes become visible in their course, which he thought was from north to fouth, and thus exhibit the beautiful corrufcations of the aurora borealis. Had Dr Halley, however, known that a stroke of electricity would give polarity to a needle that had it not, or reverse the poles of one that had it before, he would undoubtedly have concluded, the electric and magnetic effluvia to be the same, and that the aurora borealis was this fluid performing its circulation from one pole of the earth to the other. In fact, this very hypothehe is adopted by S. Beccaria; and by the supposed circulation of the electric fluid he accounts for the phenomena of magnetism and the aurora borealis in a manner perfectly fimiler to that of De Halley, only changing the phrale magnetic effects for electric fluid. The fol-

lowing is the account given us by Dr Priefley of Beccaria's ferencement on this matter and Since a Tollier threat of lightning giver polarity to magnets be entired town that a superior and continue of continues of the state of the state of the priefle of the state of the state

"That shis the state of the sails no proof of the sails o

as he was a secure of the secure of the second of the seco

A direct disproof of this circulation, however, is furpilhed by the observation of Mr Forster already mentioned with which, though neither Dr Helley nor S. Become wind be acquainted, they might have thought of it as a final proof either of the truth or fallehood of their hypothesis. If the surora boresis is no other than the electric fluid performing the above-mentioned circulation, it ought to dart from the horizon towards the zenith in the northern hemisphere, and from the zenith to the horizon in the fouthern one; but Mr Forfter plainly tells us, that the columns shot up from the horizon towards the zenith as well in the fouthern hemifphere as in the northern; so that if the aurora borealis is to be reckoned the flashings of electric matter, its course is plainly directed from both poles towards the equator, and not from one pole to the other.

Concerning the cause of this phenomenon, Mr Canton has the following query: " Is not the aurora bo-

realis the flashing of electrical fire from positive towards negative clouds at a great diftance, through the upper part of the atmosphere where the relitance is least?" But to this we must reply in the negative; for in this case it would flash in every direction according to the position of the clouds, as well as from north to fouth. Belides this query, he conjectures, that when the needle is disturbed by the aurora borealis, that phenomenon proceeds from the electricity of the heated air; and supposes the air to have the property of becoming electric by heat, like the tourmalin. But neither does this hypothesis appear at all probable; because, in such a case, the aurora borealis ought to be most frequent in fummer when the air is most heated, whereas it is found to be the reverse. Lastly, With these electrical hypotheses we shall contrast that of Mr Mairan, who imagined this phenomenon to proceed from the atmosphere of the fun, particles of which were thrown off by its centrifugal force acquired by his rotation on his axis; and that these particles falling upon the atmosphere of the earth near its equatorial parts, were from thence propelled by the diurnal motion of the earth fowards the polar regions where they formed the aurora borealis. This hypothetis, beades its being a mere supposition unsupported by one fingle appearance in nature, is liable to the objection sirendy mentioned; for in this case the light should dart from the

tioned; for in this case the light facult dark from the equator to the poles, and not from the poles to the equator; or if we haple imposents subtent to be gradually accumulated no case of the pales, we take then make after forposents secured to the pales, we take then make after forposents secured to the pales, we take the providing rapidity in three or case the secured to happen the secured to find any state.

The lift are the secured to the secured to find any state of the surface of the surface to the secured to find any state of the secured to find the secured to secure the secured to secure the secured to secure the secured to secure the secure that the secure the secure the secure that the secure the secure which the secure which the secure which is the secure of secure the secure which is the secure of a purple colour. The salling of this light therefore from the denteregions of the atmosphere into fuch as are more rate, and the transitions through mediums of different dentity, he reakons the cause of the aurors borealis, and of the different colours it assumes.

Dr Hamilton's proof, then, of the electricity of the aurora borealis, confifts entirely in the refemblance the two lights bear to one another; and if to this we add, that, during the time of an aurora borealis, the magnetic needle hath been diffurbed, electric fire obtained from the atmosphere in plenty, and at some times different kinds of rumbling and hissing founds heard, we have the sum of all the positive evidence in favour of the electric hypothesis.

Was the aurora boreals the first natural phenomenon the solution of which had been attempted by electricity, no doubt the proofs just now adduced would be very insufficient: but when it is considered, that we have indisputable evidence of the identity or the phenomena of thunder and of electricity; when we also consider, that the higher parts of our atmosphere are continually in a strongly electrified state; the analogy becomes so strong that we can scarce doubt of the aurora borealis arising from the same cause. The only difficulty is, to give a good reason why the electricity of the atmosphere should be constantly found to direct its course from the poles towards the equator, and not from the equator to the poles; and this we think may be done in the following manner:—

r. It is found that all electric bodies, when confi. See Electrably heated, become conductors of electricity; thus tricks passed hat air, hot glass, melted rosin, scaling wax, &c. are sim. all conductors, till their heat is dissipated, and then

they again become electrics.

z. As the converse of every true proposition ought also to be true, it follows from the above one, that if electrics when heated become conductors, then nonelectrics when subjected to violent degrees of cold ought to become electric. In one instance this has been verified by experience; water, which is a conducfor which warm or not violently cooled, is found to become electric when cooled to 20° below o of Fahren. heit's thermometer. With regard to metallic substances, indeed, no experiments have as yet been made to determine whether their conducting power is affected by cold or not. Very probably we might not be able to produce fuch a degree of cold as fenfibly to leffen their conducting power; but still the analogy will hold; and, as we are by no means able to produce the greatest degree of cold possible, reason will always suggelt to us, that if a certain degree of cold changes one conductor into an electric, a sufficient degree of it will allo change all others into electrics.

3. If cold is sufficient to change conducting subfrances into electrics it must also increase the electric power of such substances as are already electric; that is to say, every cold air, glass, rosin, &c. provided they are dry, will be more electric than when they are warmer. With regard to air, which is most to our present purpose, this is rendered extremely probable, by considering that clear frosty weather is of all others the most savourable for electric experiments. They may be made indeed to equal advantage almost in any state of the atmosphere, provided sufficient pains is used, but in dry hard frosts they will succeed much

more easily than at any other time.

These three axioms being allowed, the cause of the surora borealis is easily deduced from them. The air, all round the globe, at a certain height above its furface, is found to be exceedingly cold, and, as far as experiments have yet determined, exceedingly electrical allo. The inferior parts of the atmosphere between the tropics, are violently heated during the daytime by the reflection of the fun's rays from the earth. Such air will therefore be a kind of conductor, and much more readily part with its electricity to the clouds and vapours floating in it, than the colder air towards the north and fouth poles. Hence the prodigious appearances of electricity in these regions, showing itself in thunder and other tempests of the most terrible kind. Immense quantities of the electric fluid are thus communicated to the earth; and the inferior warm atmosphere having once exhausted itself, must necestarily be recruited from the upper and colder region. This becomes very probable from what the French mathematicians observed when on the top of They were often involved in one of the Andes. clouds, which, finking down into the warmer air, appeared there to be highly electrified, and discharged themselves in violent tempests of thunder and lightming; while in the mean time, on the top of the mountain, they enjoyed a calm and ferene sky. In the temperate and frigid zones, the inferior parts of the atmosphere never being fo strongly heated, do not part with their electricity to easily as in the torrid zone, and confequently do not require fuch recruits from the upper regions: but notwithstanding the difference of heat observed in different parts of the earth near the furface, it is very probable that at confiderable lieights the degree of cold is nearly equal all round it. Were there a like equality in the heat of the under part, there could never be any confiderable loss of equilibrum in the electricity of the atmosphere: but as the hot air of the torrid zone is perpetually bringing down vall quantities of electric matter from the cold air that lies directly above it; and as the inferior parts of the atmosphere lying towards the north and fouth poles do not conduct in any great degrees; it thence follows, that the upper parts of the atmosphere lying over the torud zone will continually require a fupply from the northern and fouthern regions. This eafily shows the necessity of the electric current in the upper parts of the atmosphere from each pole towards the equator: and thus we are also furnished with a reason why the aurora borealis appears more frequently in winter than in fummer; namely, because at that time the electric power of the inferior atmosphere is greater on account of the cold than in summer; and consequently the abundant electricity of the upper regions must go almost wholly off to the equatorial parts, it being imposfible for it to get down to the earth: hence also the aurora borealis appears very frequent and bright in the frigid zones, the degree of cold in the upper and dader regions of the atmosphere being much more nearly equal in these parts than in any other. In some parts of Siberia particularly, this meteor appears confiantly from October to Christmas, and its corruscations are faid to be very terrifying. Travellers agree, that here the aurora borealis appears in greatest perfection's said it is to be remarked, that Siberia is the coldest country on earth. In confirmation of this, it may also be observed, that, from the experiments hitherto made with the electrical kite, the air appears confidently more electrical in winter than in fummer, though the clouds are known to be often most violently electrified in the fummer time; a proof, that the electricity naturally belonging to the air is in fummer much more power drawn off by the clouds than in the winter, owing the excess of heat in summer, as already obferved.

A confiderable difficulty, however, still remains from the upright position which the streams of the aurora borcalis are generally observed to have; whereas, according to the hypothesis above mentioned, they ought rather to run directly from north to south. This difsiculty occurred to Dr Halley; but he answers it by supporting his magnetic effluvia to pass from one pole height above the earth, and confequently darting from the places whence they arose almost like the radii of a circle; in which case, being sent off in a direction nearly perpendicular to the surface of the earth, they must necessarily appear erect to those who see them from any part of the surface, as is demonstrated by mathematicians. It is also reasonable to think that they will take this direction rather than any other, on account of their meeting with less resistance in the very high regions of the air than in such as are lower.

But the greatest difficulty still remains: for we have supposed the equilibrium of the atmosphere to be broken in the day time, and restored only in the night; whereas, considering the immense velocity with which the electric sluid moves, the equilibrium ought to be restored in all parts almost instantaneously: yet the aurora borealis never appears except in the night, although its brightness is such as must sometimes make it visible to

us did it really exist in the daytime.

In answer to this it must be observed, that though the passage of electricity through a good conductor is instantaneous, yet through a bad conductor it is obtherefore, unless very victimitely heated, is but a bad conductor of electricity. Theory the equilibrium is it is broken, it can be so means he internancoully reflored. Add to this, that is it in the section of the life which which breaks the equilibrium. In the lame action, extending over hilf the pible, present almost say streap to reflore it in the lame action, extending over hilf the pible, present almost say streap to reflore it in the strong stream of the atmost and the lame action which a variety of all the strong stream of the atmost section of the atmost section of the atmost section of the strong stream of the strong stream of the strong stream of the strong ductor of ciedlicities though the equilibrium in it is rounding the firing. This was in the daytime pour had it been night, he imagined it must have been four or five feet in diameter; and as the firing was 780 feet fong Madould probably have feemed pyramidal pointing upwards like one of the fireams of the surrors borealis. A still more remarkable appearance, Dr Priestley tells us, was observed by Mr Hartman. "He had been making electrical experiments for four or five hours together in a very fmall room; and upon going out of it, and returning with a light in his hand, walking pretty quick, he perceived a small flame following him at about three feet distance. Being alarmed at this appearance, he stopped to examine it, upon which it vanished. This last instance is very remarkable, and fingular in its kind: from both, however, we are sufficiently warranted to conclude, that small portions of our atmosphere may by various causes be so much electri-

Aurora fied as to fhine, and likewise be moved from one place Borealis, to another without parting with the electricity they have received, for a confiderable time.

The coroua, or circle, which is often formed near the zenith by the aurora borealis, is eafily accounted for in the fame manner. As this corona is commonly stationary for some time, we imagine it would be a very proper mark whereby to determine the distance of the meteor itself. If an aurora borealis, for instance, was observed by two persons, one at London, and the other at Edinburgh; by noting the stars among which the corona was observed at each place, its true altitude from the furface of the earth could eafily be determined

by trigonometry.

Under the article Atmosphere it was suggested, shat no good proof had been as yet brought for the extreme rarity of the air usually supposed to take place at no very great heights above the earth. The brightseis of the meteor there mentioned at 70 miles perpea-dicular from the furface, as also its figure, feemed to prove the air confiderably denfer at that diffance from the earth. Though the height of the surora boresties has never been determined, we can learce imagine it to he greater than that of this meteor, or indeed forgreat; but although its ffreams relamble the passage of electric light through a vacuum, at cannot be from thence
inferred, that the sig is at all me that finalize to the vacautim of an air pump in host plants where the sorrors
because of societies and the state finalized of finalhat appearance and the state finalized of finallate appearance and the state finalized of finalall appearance and the state finalized of finalall appearance and the state finalized of finalized o and deale, maines may thouse, clust blue as the second of the seco velocity, and finally almost cover the whole sky up to the zenith. The dreses are then feen meeting toges ther in the zenith; and produce an appearance as if a vall cent was expanded in the heavens, glittering with gold, rubics, and fapphire. A more beautiful fpectache cannot be painted; but whoever should fee fuch a northern light for the first time, could not behold it without terror. For however fine the illumination may be, it is attended, as I have learned from the relation of many persons, with such a histing, cracking, and sulhing noise throughout the air, as if the largest fireworks were playing off. To describe what they then hem, they make use of the expression, Spolochi chodjat, Vol. II. Part II.

that is, the raging hoft is passing. The hunters who Auror purfue the white and blue foxes in the confines of the Borealis Icy fee, are often overtaken in their course by these northern lights. Their dogs are then fo much frightened, that they will not move, but lie obstinately on the ground till the noise has passed. Commonly clear and calm weather follows this kind of northern lights. I have heard this account, not from one person only, but confirmed by the uniform tellimony of many, who have spent part of several years in these very northern regions, and inhabited different countries from the Yenelei to the Lena; so that no doubt of its truth can remain. This feems indeed to be the real birth-place of the ourora berealis."

The hifting or rufning noise above described, Dr Blagden is inclined to attribute to small streams of electrie matter running off to the earth from the masses or accumulations of electricity by which the northern

lights are supposed to be produced.

We shall conclude this article with an account of a Aurora hoper presented to the Royal Society by Mr Winn, in realissue-Type wherein he lays that the appearance of an au-eccded by some bounding is a certain fign of a hard gale of wind fouth-well from the fouth or fouth-well. This he never found to in 33 inflances; and even thinks, that from the friendour of the meteor, some judgment may be formed concerning the ensuing tempest. If the aurora is very bright, the gale will come on within twenty-four hours, but will be of no long duration; if the light is faint and dall, the gale will be lefs violent, and longer in toming on, but will also last longer. His observations were made in the English channel, where such winds the try dangerous; and by attending to the aurora, the trys he often got easily out of it, when others narcheaped being wrecked. This is an exceeding wieful observation for failors: but it cannot be expected that the winds succeeding these meteors should in all places blow from the fouth-west; though no doubt a gareful observation of what winds succeed the aurora borealis, and other meteors, in different parts of the world, might contribute in some measure to lessen the dangers of pavigation.

of Bilony, the electric matter which has been received at the equator during an aurora boscalis will be difcharged there some time after, and consequently a wind will blow from that quarter, which will be from the fouth-west to those ships which are in the English

channel.

Aufona.

Aurum channel. It cannot be imagined, however, that all the matter can be discharged from one place; and therefore according to the different fituations of those electrical vents, winds may blow in different directions; and thus the same aurora borcalis may produce a southwest wind in the English channel, and a north-west one in Scotland.

> AURUM. See Gold, CHEMISTRY, and METAL-LURGY.

This metal was introduced into medicine by the Arabians, who esteemed it one of the greatest cordials and comforters of the nerves. From them Europe received it without any diminution of its character; in foreign pharmacopæias it is flill retained, and even mixed with the ingredients from which simple waters are to be distilled. But no one, it is presumed, at this time expects any fingular virtues from it, fince it certainly is not alterable in the human body. Mr Geoffroy, though unwilling to reject it from the cordial preparations, honeftly acknowledges that he has no other reason for retaining it than complailinge to the. Arabian schools. The chemists have endeavoured by many elaborate processes, to extract what they call a fulphur or anima of gold : but no method is as yet. known of separating the component parts of this mer tal; all the tinctures of it, and aurum potabile, which have hitherto appeared, are real folutions of it in sons. regia, diluted with spirit of wine or other liquors, and prove injurious to the body rather than beneficial. . A place, however, is now given in fome of the foreign pharmacoperias to the aurum fulminans; and it has of late been recommended as a remedy in some convulsive difeases, particularly in the chorea fancti viti.

AURUM Fulminans. See CHEMISTRY, Index.

AURUNCI (anc. geog.), a people of Latium, towards Campania; the same with the Ausones at least fo intermixed as not to be eafily diflinguishable, though Pliny separates them.

AUSA, a town of Tarraconensis, in the middle age called Aufona; now Vich de Ofona, a town of Catalonia in Spain. E. Long. 2. o. N. Lat. 41. 50 in.

AUSCH. See Auch. AUSI, an ancient and very favage people of Libya. Herodotus tells us that they were imagginated with marriage, and had all their women in common. The children were brought up by their mothers till they were able to walk; after which they were introduced to an affembly of she men, who met every line, months; and the man to whom any child, first single acknowledged himself, its factor. They pelebrated annually a feat in honour of historia, at which the girls divided into two companies, lought with lifeks and stones, and those who died at this mands were concluded not to have been virgins.

All SIMITM, or Augustus at ancient Roman con-

AUSIMUM, or Aurimum, an ancient Roman colony in the Picerums now Ofmo or Ofmo, in the marquifate of Ancona in Italy. E. Long. 15, N. Lat. 43. 20.

AUSITA, or Agara, a tribe of encient Arabs, supposed by Bochart to have inhabited the land of Uz mentioned in Scripture.

AUSONA (anc. geog.), a town of the Aufones, a people who anciently occupied all the Lower Italy, from the Promontorium Circum down to the straits

of Sicily (Livy), but were afterwards reduced to a Ausoni much narrower compais; namely, between the Montes Circaei and Maffici: nor did they occupy the whole of this, but other people were intermixed. Concerning Ausona or its remains, there is nothing particular recorded.

AUSONIA, the ancient name of Italy, from its most ancient inhabitants the Ausones, (Virgil, Servius).

AUSONEUM MARE (anc. geog.), a part of the Yonian fea, extending fouthwards from the promontory Japygium to Sicily, which it washes on the east, as it does the Bruttii and Magna Gracia on the fouth and east. It is separated from the Tuscan sea by the strait of Messina.

AUSONIUS (in Latin Decius, or rather Decimus, Magnus Aulonius), one of the best poets of the fourth century, was the fon of an eminent physician, and born at Bourdeaux. Great care was taken of his education, the whole family interesting themselves in it, either because his genius was very promising, or that the scheme of his mativity, which had been can by his grandfather on the mother's fide, made them imagine that he would rile to great honour. He made an uncommon progreas in claffical learning, and at the age of 30 was cholen to teach grammar at Bourdeaux. He was promoted forme time after to be professor of rhetoric; in which office be acquired to great's reputation, that he was lent for is mour to be perfectly to training the emperor Yalentson to the time and hopening conferred on the professor at the professor to great conferred on the professor at the professor to the conferred on the professor to the conferred on the professor to the prof fire prove the tune pleases (in the dignit (a) copiul by having tille digoera es and in his mangers and his livie toes is a hardness which was perhaps rather the delect of the times he lived in chan of his penias. Had he been a Augustus reign, his vertes, according to good hidges, would have equalled the mon anished of that age. He is generally supposed to have been a Christian; same ingenious authors indeed think otherwife, but, locording to Mr Bayle, without just region. The Left edition of his poems is that of Applerdam in

AUSPEX, a name originally given to those who were afterwards denominated augues. In which lenfe the word is supposed to be formed from avis, " bird," and inspicere, "to inspect;" auspices, q. d. avispices. Some will therefore have suspices properly to denote those who foretold future events from the fight of

AUSPICIUM, Auspicy, the same with augury. AUSTER, one of the four cardinal winds, as SerAuthore vius calls them, blowing from the fouth, (Pliny, Ovid,

AUSTERE, rough, aftringent. Thus an auftere tafte is such a one as constringes the mouth and tongue; as that of unripe fruits, harth wines, &c.

AUSTERITY, among moral writers, implies feverity and rigour. Thus we fay, Austerity of manners, austerities of the monastic life, &c.

AUSTIN (St) See St Augustin.

AUSTRAL, Australis, the same with fouthern. The word is derived from aufter, " fouth wind." Thus auftral figns are the fix last figns of the zodiac; fo called because they are on the fouth side of the equinc&ial.

AUSTRALIS PISCIS, the Southern Fish, is a conficulation of the fouthern hemisphere, not visible in our latitude; whose stars in Ptolomy's catalogue are

18, and in the Britannie catalogue 24.

AUSTRIA, one of the principal provinces of the empire of Germany towards the cast; from which ittuation it takes its name Ooft-ryck, in the German language figuifying the Euft Country. It is bounded on guage figurifying the Euft Country. It is bounded on the north by Moravia; on the east by Hungary; on the fouth by Stiria; and on the well by Bavatia. It is divided into Upper and Lower Austria on the borth fide of the Danube. Vielna the abital is in the Upper Austria, which contains the borth fide of the Danube. Vielna the abital is in the Upper Austria, which contains the borth fide of the Danube. It produces via guarantees of infamin.

In the black of the produces via guarantees of infamin. In ora, the contest of the boundary of the contains and the frontier of the contains and the contest of the

Antia was the sus. In 928, and that it was the Mauffin Red Leopold, Otho Leopold Sus of his broadenty II. was receive Barthall 1,400, the bestern the melves of the leopold for the second of the Baseline and Lungarians, and comparisons, and comparisons, and comparisons of Henry margain of Milita, but Othogar H. king of Boliemin, being likewife invited by a party in the duchy, took possession of it, alleging not only the invitation of the states, but also the right of his wife, heltels of Frederic the last duke. The emperor Rodolphus I, pretending a right to this duchy, refused to give Othogar the investiture of it; and afterwards killing him in a battle, procured the right of it to his own family. From this Rodolphus the present house of Austria is descended, which for feveral centuries patt has rendered itself fo famous and fo powerful, having given 14 emperors to Germany, and fix kings to Spain.

In 1477, Austria was erected into an archduchy by the emperor Frederic the Pacific for his fon Maximilian, with these privileges: That these shall be judged to have obtained the investiture of the states, if they do not receive it after having demanded it three times; that if they receive it from the emperor, or the imperial ambassadors, they are to be on horseback, clad in a royal mantle, having in their hand a staff of command, and upon their head a ducal crown of two points, and

furrounded with a cross like that of the imperial crown. Austria. The archduke is born privy counfellor to the emperor, and his states cannot be put to the ban of the empire. All attempts against his person are punished as crimes of lefe-majefly, in the same manner as those against the king of the Romans, or electors. No one dared to challenge him to fingle combat. It is in his choice to affift at the affemblies, or to be abfent; and he has the privilege of being exempt from contributions and public taxes, excepting 12 foldiers which he is obliged to maintain against the Turk for one month. He has rank immediately after the electors; and exercises justice in his states without appeal, by virtue of a privilege granted by Charles V. His subjects cannot even be fummoned out of his province upon account of lawfuite, to give witness, or to receive the investiture of fiefs. Any of the lands of the empire may be alienated in his favour, even those that are feudal; and he has a Hight to create courts, barons, gentlemen, poets, and 'notaries. ' In the fuccession to his estates. the right of birth takes place; and, failing males, the females fuceced according to the lineal right; and if no heir be found; they may dispose of their lands as they please.

Upper Austria, properly so called, has throughout the appearance of a happy country; here are no figns of the striking contrast betwixt poverty and riches which offends to much in Hungary. All the inhabitants, those of the capital only excepted, enjoy that happy mediocrity which is the consequence of a gentle and wife administration. The farmer has property; and the rights of the nobility, who enjoy a kind of lower judicial power, are well defined. The fouth and fouth-west parts of the country are bounded by a ridge of hills, the inhabitants of which enjoy a share of prosperity unknown to those of the interior parts of France. There are many villages and market towns, the inhabitants of which have bought themselves off from vasfalage, are now their own governors, and belong some of them to the estates of the country. The cloisters, the prelates of which belong to the estates of the country, are the richest in Germany, after the immediate prelacies and abbacies of the empire. One of the great convents of Benedictines is worth upwards of 4000 millions of French livres, half of which goes to the exchequer of the country.

Lower Auftria yearly exports more than two milkons worth of guilders of wine to Moravia, Bohemia, Upper Augris, Bavaria, Saltzburg, and part of Sti-Fin the Carinthia. This wine is four, but has a great desirof Brougth, and may be carried all over the world without dangers when it is ten or twenty years old it is very good. This country is very well peopled. Mr Schlosser, in his political journal, which contains an account of the population of Authria, estimates that of this country at 2,100,000 men, The revenue of this country is about 14,000,000 of floring; of which the city of Vienna contributes above 5000,000 as one man in the capital carne as much as three in the country.

The fouthern parts of Austria are covered with hills. which rife gradually from the banks of the Danube to the borders of Stiria, and are covered with woods. They lofe themselves in the mass of mountains which run to the fouth of Germany, and firetch through all Stiria, Carniola. Carinthia, and Tyrol, to the Swife Alps; and are probably, after Savoy and Switzerland,

4 T 2

Austria, the highest part of the earth. The inhabitants of this extensive ridge of mountains are all very much alike; they are a strong, large, and, the Goitres excepted, * very handlome people.

The characteristic of the inhabitants of all this country is striking bigotry, united with striking fenfuality. You need only fee what is going forwards here to be convinced that the religion taught by the monks is as ruinous for the morals as it is repugnant to Christianity. The cicifbeos accompany the married women from their bed to church, and lead them to the very confessional. The bigotry of the public in the interior parts of Austria, which from the mixture of gallantry with it, is still to be found even amongst people of rank, degenerates amongst the common people into the groffest and most abominable buffoonery. The Windes, who are wined with the Germans in thele countries, diftinguith themselves by a superflitious custom that does little herone to the his man understanding, and would be incredible it we had not the most unequivocal proofs of the fact before out. eye. Many years ago, they fet out in company with fome Hungarian enthuliafts to Cologne on the Mine. which is about 120 German miles diftant, to cut off the beard of a crucifix there. Every fevently this operation is repeated, as in this space of time the board grows again to its former length. The rich persons of the affociation fend the poorer ones at their deputics, and the magistrates of Cologne receive them as ambassadors from a foreign prince. They are entered tained at the expence of the state, and a counfellor shows them the most remarkable things in the hows. This farce brings in large fums of money at stated times, and may therefore deferve political encouragement; but ftill, however, it is the most miserable and meanest way of gain that can be imagined. These Windes have alone the right to shave our Saviour, and the heard grows only for them. They firmly believe, that if they did not do this fervice to the crucifix the earth would be flut to them for the next feven years. and there would be no harvefts. For this reason they are obliged to carry the hair home with them, as the proof of having fulfilled their commission, the returns of which are diffributed amongst the different communities, and preferved as holy relies. The imperial court has for a long time endeavoured in white prevent this emigration, which deprives agriculture of to many unfeld hands. When the Windes could an perpenty they would go clandefinely. At least the country thought of the expedient of forbidding the tegenty at Cologne to let them enter the town. The happened fix years ago, and the numerous emball, was difficult being its way back again without the wonderful being the without doubt the country to the wonderful being the without doubt the country to the wonderful being the without doubt the country to the wonderful being the without doubt the country to the wonderful being the wonderful being the without doubt the country to the wonderful being the wonderful which without doubt the capaciting to whom the diacifix belonged, used to put together from their own. The trade which the monks carry on with hely labels. oils, &c. is very confiderable; a probabilion of the court, lately published, has rather lessened it, but it be entirely suppressed till next generation. It great an amount as formerly.

AUSTROMANCY, Austromantia, properly, denotes foothfaying, or a vain method of predicting futurity, from observations of the winds.

AUTERFOITS ACQUIT. 7 See the article PLEA . Auterfoits Attaint. AUTERIOITS Convil.

to Indiament.

Autrefalts Autograph

AUTHENTIC, fomething of acknowledged and received authority. In law, it fignifies fomething clothed in all its formalics, and attested by persons to whom credit has been regularly given. Thus we fay, authentic papers, authentic instruments.

AUTHOR, properly fignifies one who created or produced any thing. Thus God, by way of eminence, is called the Author of nature, the Author of the

universe.

AUTHOR, in matters of literature, a person who has

composed some book or writing.

AUTHORITY, in a general tenfe, tignines a right to command, and make one's felf obey d. In which fense we say, the roy if authority, the epifcolal author rity, the authority of a jather, &c. It denotes also the rellimony of an author, fome apophthegm or fentence of an eminent person quoted in a discourse by way of proof.

dathorny is represented, in painting, like a grave mation litting in a chair of flate, richly clothed in a arment embroidered with gold, holding in her right hand a lword, and in her left a fceptre. By her fide

hand a Iword, and in her left a feeptre. By her tide is a double trophy of books and arms.

AUTOCHTHORES, an appellation assumed by fone nations, importing that they forum, or were produced, from the same told association of little single-left. In this fende, Amechabers arrangement the farms with their fender. The Amechabers arrangement the farms with their fenders. The American arrangement the farms with the being kill benefit for the proper and the personnel of the proper and the personnel of the plants. The proper Autochthores with the service men who mad no other plants of the farms and the proper autochthores with the service men who mad no other plants of the service of the service provided they never charged the matter of these men provided they never charged the matter of these services are the service of the se poled to have the fame origin.

AUTOCRATOR, a perion veffed with an abidiste. independent power, by which he is rendered unaccountshift to tay other for his actions. The power of the Athenian generals, or commanders, was usually limited .: in that, at the expiration of their office, they were lings big to render an account of their administration. " Buta" on hime extraordinary occasions, they were exempted. from this reftraint, and fent with a full and uncontroul. able authority : in which fense they were styled Apreremeiges. The same people also applied the same to some of their ambassadors, who were vested with a full power of determining matters according to their own discretion. These were denominated Heisens Assured

rogse, and refembled our plenipotentiaries.

AUTO DA FE, act of faith. See Acr of Faith. AUTODIDACTUS, a person self-taught, or who has had no mafter or affiftant of his studies besides, himfelf.

AUTOGRAPH, denotes a person's hand writting, or the original manuscript of any book, &c.

AUTOLITHOTOMUS.

Autolitho-

AUTOLITHOTOMUS, he who cuts himself for tomus the stone. Of this we have a very extraordinary in-Autonomia, stance given by Reiselius, in the Ephemerides of the Academy Nature Curioforum, dec. 1. an. 3. obs. 192.

AUTOMATE, called also Hiera, one of the Cyclades, an island to the north of Crete (Pliny), faid to have emerged out of the fea, between the islands Thera and Therafia, in the fifth year of the emperor Claudius; in extent thirty stadia, (Orosius).

AUTOMATON, (from autos ipfe, and maouns excitor) a felf-moving machine, or one fo constructed, by means of weights, levers, pulleys, &c. as to move for a confiderable time, as though endowed with animal life. According to this description, clocks, watches, and all machines of that kind, are automata.

Under the article Androinis we observed that the highelt perfection to which automata could be carried was to imitate exactly the motions and actions of living creatures, especially of mankind, which are more diff. R. Lat. 50. 40. AUTRICUM, the capital of the Carnutes, a peofurprising initations, however, have been made of other creatures. So long ago as 400 years before Christs. Archytas of Tarentum is said to have made a wooden pigeon that could fly; nor will this appear at all increa dible, when we consider the flute-player made by M. Vaucanion, and the chels player by M. Kempen. Dr Hook is also faid to have made the model of a flying chariot, capable of supporting itself in the gir. Ber M. Vancandon above mentioned hath diftinguished himself thill more embinetty. That gentleman, exconsinged by the fewerable reception of his flate player, made a deals which was expalled of entire. Grinkings and initiating causily the consultation of embined was evacuated in a digetted flate that the law of the confiderably attend from what it was when instructed and this digetted was performed in the principles of follution, and of triumation. The wages interest and bones, of the investigate these of a little was performed in the principles of follution, and of triumations due were also before the principles of the law of the principles of the law of t M. Vaucation above mentioned half diftinguished him.

Mi le Droz of La Chaux de Fonde in county of Newschattel, hath also executed some very curious pieces of mechanilm, which well deferve to be ranked. with those already mentioned. One was a clock, which was prefented to his Spanish majesty; and had ummag other curiofities, a fleep, which imitated the bleating of white one; and a dog watching a balket of fruits When any one attempted to purloin the fruit, the down gnashed his teeth and barked; and if it was actually taken away, he never ceased barking till it was restored. Befides this, he made a variety of human figures, which exhibited motions truly furprising; but all inferior to Mr Kempell's chess-player, which may juftly be looked upon as the greatest masterpiece in mechamics that ever appeared. See Androides.

AUTONOMIA, a power of living or being governed by our own laws and magistrates. The liberty of the cities which lived under the faith and protection of the Romans, confisted in their, autonomia,

i. e. they were allowed to make their own laws, and Autopyros elect their own magistrates; by whom justice was to be administered, and not by Roman prefidents or judges, as was done in other places which were not indulged the autonomia.

AUTOPYROS, from autos, and nugos, wheat : in the ancient diet, an epithet given to a species of bread, wherein the whole substance of the wheat was retained without retrenching any part of the bran. Galen describes it otherwise, viz. as bread where only the coarler bran was taken out. And thus it was a medium between the finest bread, called finilagineus, and the coarfest called farfuraceus. This was also called autopyrites and filleomiflur.

AUTRE ecurit, a village of Brabant, in the Austrian Netherlands; to which the left wing of the French army extended, when the confederates obtained the victory at Ramillies, in 1706. E. Long. 4. 50.

ple of Gallie Celtica; afterwards called Carnotena, Carnotinus, and Civitas Carnotenum : Now Chartres, in the Orleannois, on the Eure. E. Long. 1. 32. N. Lat.

48. 47. AUTUMN, the third scason of the year, when the barrest and fruits are gathered in. Autumn is reprefented in painting, by a man at perfect age, clothed like the vernal, and likewife girded with a ftarry girdle; holding in one hand a pair of scales equally poifed, with a globe in each; in the other hand a bunch of divers fruits and grapes. His age denotes the perfection of this feafon; and the balance, that fign of the zodisc which the fun enters when our autumn begins.

Autumn begins on the day when the fun's meridian diftance from the zenith, being on the decrease, is a mean between the greatest and the least; which in these countries is supposed to happen when the sun enters Inbia Aftend coincides with the beginning of winfer Several nations have computed the years by acrumns; the English Saxons, by winters. Tacitus cells us, the ancient Germans were acquainted with all the other feafons of the year, but had no notion of surumn. Lidyat observes of the beginning of the feveral leafing of the year, that Dir Chillian byemem, dat Petrus ver cathedratus,

Elect Urbanus, autumnat Bartholomeus.

destroite atways been reputed an unhealthy feafon. Terrallian culle it tentater valetudinum : and the fatirift

bra, Scorpio, Sagittarius, through which the fun passes during the autumn.

Autowast Equinos; that time when the fun enters

the autumnal point.

AUTUN, an ancient city of France, in the duchy of Burgundy, the capital of the Autunois, with a bishop's fee. The length of this city is about three quarters of a mile, and its breadth nearly equal. The river Arroux walkes its ancient walls, whose ruins are so firm, and the stone so closely united; that they feem almost to be cut out of the folid rock. In this city are the ruingAuturn of three ancient temples, one of which was dedicated to Janus, and another to Diana. Here are likewise a Auxy. theatre and a pyramid, which last is probably a tomb; it stands in a place called the field of urns, because feveral urns had been found there. Here are also two antique gates of great beauty. The city lies at the foot of three great mountains, in E. Long. 4. 15. N. Lat.

45. 50. AUTURA, or Audura, a river of Gallia Celtica, only mentioned in the lives of the faints. Now the Eure, which falls into the Scine, on the left hand or

Touth fide.

AUVERGNE, a province of Erance, about 100 miles in length and 75 in breadth. It is bounded on the north by the Bourbonnois on the east by Force and Velay; on the well, by Limolin, Quercy, and La Marche; and on the fouth, by Rovergue and the Cevennes. It is divided into upper and lower; the latter, otherwise called Limagne, is one of the finest constries in the world. The mountains of Higher Auvergne render it less fruitful; but they afford good pasture; and feed great numbers of cattle, which are the wich cs of that country. Auvergne supplies Lyons and Paris with fat cattle, makes a large quantity of cheefe, and has manufactures of feveral kinds. The capital of the whole province is Clermont.

AUVERNAS, a very deep-coloured heady wine, made of black raifins to called, which comes from Orleans. It is not fit to drink before it is above a year old; but if kept two or three years, it becomes ex-

AUXERRE, an ancient town of France, in the duchy of Burgundy, and capital of the Auxerrois, with a bishop's see. The epiteopal palace is one of the finest in France, and the churches are also very beautiful. This town is advantageously situated for trade, with Paris, on the river Yonne. E. Long. 3. 35. N. Lat.

AUXESIS, in mythology, a goddess worshipped by the inhabitants of Egina, and mentioned by Hero-

dotus and Paufanias.

Auxysis, in rhetoric, a figure whereby any thing is magnified too much.

AUXILIARY, whatever is aiding or helping to another.

AUXILIARY Verbs, in grammar, are fuch as help to form or conjugate others; that is, are prefixed touthem. to form or denote the modes or tenies thereof; as to: have and to be, in the English; etre and avoir, in the French ; bo and fone in the Italian dec. In the Eng. lift language, the auxiliary verb am supplies the want of paffive verbs and in the see see says

AUXO is mythology, the name of one of two Graces worth ped by the Athenians. See HEGEMONE. AUXONNE, a small fortified town in France, in

the duchy Burgundy; feated on the river Saone, over which there is a bridge of 23 arches, to facilitate the running off of the waters after the overflowing of the river. At the end of the bridge is a causeway 2250 paces long. E. Long. 5. 22. N. Lat. 47. 11.

AUXY; the French give the name of auxy wool to that which is fpun in the neighbourhood of Abbevilles by those workmen who are called houpiers. It is a very fine and beautiful wool, which is commonly

nied tomake the fineft flockings.

AWARD, in law, the judgment of an arbitrator, or of one who is not appointed by the law a judge, but chosen by the parties themselves for terminating their difference. See Arbiter and Arbitration.

AWL, among shoemakers, an instrument wherewith holes are bored through the leather, to facilitate the flitching or fewing the same. The blade of the awl is usually a little flat and bended, and the point ground to an acute angle.

AWLAN, a finall imperial town of Germany, in the circle of Suabia, scated on the river Kochen. E.

Long. 11. 15. N. Lat. 48. 52.

AWME, or Aume, a Dutch liquid measure containing eight flickans, or 20 verges or verteels, equal to the tierce in England, or to one-fixth of a ton of France.

AWN, in botany. See ARISTA. "

AWNING, in the fea language, is the hanging fail, tarpawling, or the like, over any part of the thip;

to keep off the fun, rain, or wind.

AX, a carpenter's instrument, ferving to hew wood. The ax differs from the joiner's hatchet, in that it is made larger and heavier, as ferving to hew large stuff; and its edge tapening into the midit of its blade. It is furnished with a long handle or helve, as being to be used with both hands.

be used with both hards.

Battle As: Sec Char.

AKAMENTA, in antiquity, saidenomination given to the vertes or longs of the fifth which they fing in honour of all men. The work of the fitting which they fing in honour of all men. The work of the fitting which they fing to lones from menter, on the name of the fitting which they will have the carmina fadach to have been been been another than the fitting that they are not wonderly the fitting that they will be the fitting that they will be author of them was Number of any fitting the fit which they first the fitting the fitting that they for the fitting the fitting that they were not fear of the fitting that the fitting the fitting the fitting that the fitting which they have been confined which the name of a fitting the fitting of which being deposited in improve approximate the fitting of which being deposited in improve approximate the fitting of which being deposited in improve approximate which are taruther and core flags, form large medics, which are taken up by affermen and carried to market for fale. This caviate, colled abusubili, which has much the fame tafte with the caviare of fifty used to be exten by the Mexicans, and is now a common dish among the Spaniards. The Mexicans cat not only the eggs, but the flies themselves, made up together into a male, the state of the state of and prepared with faltpetre. AXATI, a town of ancient Batica, on the Batica now Lora, a small city of Andalusia, in Spain, feated

on the Gaudalquiver. W. Long. 5. 20. N. Lat. 37. 20. AXBRIDGE, a town of Somerfetshire in England, confishing of one long narrow fireet. W. Long. 2. 20. N. Lat. 51. 30.

AXEL, a small fortified town in Dutch Flanders.

E. Long. 3. 40. N. Lat. 51. 17.

AXHOLM, an island in the north-west part of Lincolnshire in England. It is formed by the rivers Trent, Idel, and Dan; and is about ten miles long and five broad. The lower part is marshy, but produces an odoriferous

odoriferous shrub called gall; the middle is rich and fruitful, yielding flux in great abundance, as also ala-Axinoman-bafter which is used for making lime. The principal town is called Axey, and is now very thinly inhabited.

AXIACE, an ancient town of Sarmatia Europea; now Oczakow, the capital of Budziac Tartary. E. Long. 32, 30. N. Lat. 46. 0.

AXILLA, in anatomy, the arm-pit or the cavity

under the upper part of the arm.

Axilla, in botany, is the space comprehended between the flems of plants and their leaves. Hence we fay those flowers grow in the axillæ of the leaves; i. e. at the base of the leaves, or just within the angle of their pedicles.

AXILLARY, fomething belonging to or lying near the axilla. Thus, axillary artery is that part of the fubclavian branches of the afcending trunk of the aorta which paffeth under the arm-pits; axillary glands are fituated under the arm-pits, enveloped in fat, and lie close by the axillary velicle; and axillary vein is one of the subclavians which passes under the arm-pit, dividing itself into several branches, which are forcad over the arm.

AXIM, a small territory on the gold coast in Africa. The climate here is to excellively moift, that it is proverbially faid to rain 11 months and 29 days of the year. This excellive moifture graders it very sinhealthy; but it produces great quantities of rice, water inclons, lemona prenger, the site of rice, water inclons, numbers of instructions of the site of the produced was numbers of history like, greats, there, tamening considered before which the native construction and pupulous inleges, and the intermediate lands well full tighted before which the native construction was from the constant walls cannot be suffered by the called well full tighted called fam, by lone schools and made in the transport of the production of the point of the source of the whole declicity of a neighborizing balls. Intereses the two and the transport of a neighborizing balls. Intereses the two and the transport of a neighborizing balls. Intereses the two and the transport of the site of the sit verbially fuid to rain 11 months and 29 days of the out. The genual is fixuated in W. Lang. 14 C. N. Lat. 3. o. Ahis canton is a kind of republic, the government being divided between the Caboccrack of chief men, and Manaceroes or young men. It must be observed, however, that in their courts there it wor even a pretence of juffice : whoever makes the most valuable prefent to the judges is fure to gain his caule, the judgesthemielves alleging the gratitude due for the bribes received as a reason; and if both parties happen. to make prefents of nearly equal value, they absolutely.

refuse to give the cause a hearing.

AXINOMANCY, AXINOMANTIA, from azimi fecuris and pailsta, divinatio: an ancient species of divination, or a method of foretelling future events by means of an ax or hatchet.-This art was in confiderable repute among the ancients; and was performed, according to some, by laying an agate stone on a redhot hatchet; and also by fixing a hatchet on a round'

stake so as to be exactly poised; then the names Axiom of those that were suspected were repeated, and he at whose name the hatchet moved was pronounced Arminster.

AXIOM, Axioma (from aliow, I am worthy); a felf-evident truth, or a proposition whose truth every person receives at first fight. Thus, that the whole is greater than a part; that a thing cannot be and not be at the fame time; and that from nothing, nothing can arife; are axioms.

Axiom is also an established principle in some art or science. Thus, it is an axiom in physics, that nature does nothing in vain; that effects are proportional to their causes, &c. So it is an axiom in geometry, that things equal to the same third are also equal to one another; that if to equal things you add equals, the fums will be equal, &c. It is an axiom in optics, that the angle of acidence is equal to the angle of reficetion, &c. *

AXIPOLIS, a town of the Triballi, in Moesia Inferior smow Axiopoli, in Bulgaria. E. Long. 34. 0. N. Lat. 45. 40.

AXIS, in geometry, the Arraight line in a plain figure, about which it revolves, to produce or generate a folid. Thus, if a semicircle be moved round its diameter at rest, it will generate a sphere, the axis of which is that diameter.

Axis, in aftronomy, is an imaginary right line suppoied to pais through the centre of the earth and the heavenly bodies, about which they perform their diurnal revolutions.

Axea, in conic fections, a right line dividing the fectien into two equal parts, and cutting all its ordinates at right angles.

Axis, in mechanics. The axis of a balance is that line about which it moves, or rather turns about. Axis of oscillation, is a right line parallel to the horizon. passing through the centre about which a pendulum

Axis in Peritrochio, one of the fix mechanical powers, confishing of a peritrochium or wheel concentric with the bafer of a cylinder, and moveable together with it about its axis.

Axis, in optice, is that particular ray of light coming from any object which falls perpendicularly onthe eye.

Arras insarchitecture. Spiral axis, is the axis of a twilled column drawn spirally in order to trace the circulated without. Axis of the lonic capital, is a line suffice percendicularly through the middle of the capital are long to an imaginary right line passing through the middle of at perpendicularly to its bate,

and equally difficult from its fides.

A run in botant, is a taper column placed in the

centre of fome flowers or catkins, about which the other parts are disposed in the

Axis, in sastomy, the name of the second vertebraof the negk; it hath a tooth which goes into the first. vertebra, and this tooth is by some called the axis.

AXMINSTER, a town of Devoushire, situated one the river Ax, in the great road between London and. Exeter, in W. Long. 3. 15. N. Lat. 50. 40. It wass a place of some note in the time of the Saxons, but nows

contains ..

Assolute contains only about 200 houses. Here is a finall manufactory of broad and narrow cloths, and fome carpets are also manufactured after the Turkey manner.

AXOLOTLE, See LACERTA.

AXUMA, formerly a large city, and capital of the whole kingdom of Abyssinia in Africa, but now reduced to a miferable village fearce containing 100 inhabitants. E. Long. 36. 4. N. Lat. 14. 13.

AXUNGIA, in a general sense, denotes old lard, or the drieft and hardest of any fat in the bodies of animals: but more properly it fignifies only hog's lard.

Azungia Vitri, Sandiver, or Salt of Glass, a kind of falt which separates from the glass while it is in fusion. It is of an acrimonious and biring taffe. The farriers use it for cleaning the eyes of bories. It is also made use of for cleaning the teeth; and it is sometimes applied to running ulcers, the herpes, or the itch, by

way of deficeative.

AXYRIS: A genus of the triandria moter, belonging to the monoccia class of plants; and in the matural method ranking under the 12th order, Males are. The calyx of the male is trinartite; it has no corolly. The calvx of the female confests of two leaves; it has two ftyli and one feed. The species are four, none of them

chaplain, and tutor to his children. Our states children was the unfortunate. The first children was the unfortunate. The first children was the unfortunate. The first children was to the Greek languages. His first preference was to the archdeaconry of Stor in the idocated the children was to the gave him a feat in the coursestion below the first present the proposed the meturn to Popera, to which the generality of the clery were inclined. He was been after obliged to fly his country, and the first first for the Protestants in were inclined. He was hom after obliged to fly his country, and take thefter smoon the Protestants in Switzerland. On the accession of Queen Elizabeth, he returned to England. In 1652, he obtained the archdeacoury of Lincoln; and was a member of the famous fynod of that year, which reformed and fettled the doctrine and discipline of the church of England. In the year 1576, he was confecrated bishop of London.

He died in the year 1594, aged 73; and was buried in St Paul's. He was a learned man, a zealous father of the church, and a bitter enemy to the Puritans. He published a piece entitled, An harbrowe for faithful and treave subjects against the late blowne blaste concerning the government of avomen, &cc. This was written whilst he was abroad in answer to Knox, who published a book at Geneva under this title, The first blast against the monstrous regiment and empire of women. He is by Strype supposed to have published Lady Jane Gray's letter to Harding. He also affilted Fox in translating his History of Martyrs into Latin.

AYRY, or Arry, of Hawks, a nest or company of hawks; fo called from the old French word aire, which

fignified the fame.

AYSCUE (Sir George), a gallant English admiral, descended from a good family in Lincolnshire. He obtained the honour of knighthood from King Charles I. which, however, did not withhold him from adhering to the parliament in the civil war; he was hy them con-Ritured admiral of the Irish seas, where he is said to baye done great fervice to the Protestant interest, and to have contributed much to the reduction of the whole Mand. In 1671 he reduced Barbadoes and Virginia, then held for the king, to the obedience of the parliaifyli and one feed. The species are four, none of them natives of Britain.

AY, a town of France in Champagne, near the river Maine, remarkable for its excellent wines. E. Long.

2. 15. N. Lat. 49. 4.

AYAMONTE, a sea-port town of Andelusa in Spain, with a strong castle built on a rock; seated on the mouth of the river Guadiana. It has a commodious harbour, fruitful vineyarda, and excellent wine.

W. Long. 8. 5. N. Lat. 37. 9.

AYENIA, in botany: A genus of the pentandris order, belonging to the gynaudria class of plants; and in the natural method ranking under the 37th order, Columnistra. The calyx has two leaves; the petals are in the form of a star, with long ungues; and the capsule has sive cells. There are three species, all natives of the West Indies.

AYLESBURY. See Allesbury. This place gave title of Farl to the noble family of Bruce, now to a branch of the Brudenals by succession,

AYLMER (John), bishop of London, in the seeing of Queen Elizabeth, was born in the year 1521, st. Aylmer-hall in the parish of Tilney. This place gave title of Farl to the noble family of Bruce, now to a branch of the Brudenals by succession, and the second of the succession of Queen Elizabeth, was born in the year 1521, st. Aylmer-hall in the parish of Tilney. The succession of Queen Elizabeth, was born in the year 1521, st. Aylmer-hall in the parish of Tilney. The succession of the west states of plants; and in the asture, succession of Sussible states of plants; and in the asture, succession and tutor to his children. Out the succession of the capsule has five cells. These are size and the capsule has five cells. These are size and the capsule has five cells. These are size and the capsule has five cells. These are size and the capsule has five cells. These are size and the capsule has five cells. The capsule state of plants; and in the

is hell-maped, the flamina are interted into the vecepspecies of which the most remarkable are the followings The viscola, with a white flower, is a low flield, and ling with feveral flems to the height of two or three ect. The leaves come out in clusters without env or-Her at the end of the fhoots, and their edges are let with very thore teeth which are rough. The flowers come out in clusters between the leaves, have much the sppearance of honeyfuckle, and are as well fcented. 2. The nudiflora, or red American upright honeyfuckle, grows taller than the first; and in its native country will sometimes arrive at the height of 12 feet, but in Britain mever rifes to above half that height. It hath feveral flems with oblong smooth leaves. The flower-flaks saide from the division of the branches, which are long and naked, Assemor 'naked, supporting a ciuster of red flowers: these are divided at the top into five equal fegments which spread open. Another species with bright red flowers was found by Mr Lightfoot upon the tops of many mountains in the highlands of Scotland. The first two specles require a moist foil and a fandy situation, and can only be propagated from flips, as they never produce ... equinox. ... good feeds in Britain. The autumn is the belt time to remove the plants, and their roots ought to be covered in winter. They are most beautiful plants, and well worth cultivating.

AZAMOR, a finall fea-port town of the kingdom of Morocco in Africa. It is fituated on the river Morbeya, in the province of Duguella, at fome confiderable diffance from its mouth. This town though formerly very confiderable, is not proper for maritime commerces because the entrance of the river is dangerous. It was unfuccelsfully believed by the Portaguele in 1508; it was taken, however, in 1513, by the dishe of Braganza, but abundoned about the end of the bandon century. W. Long. 7. o. N. Lat. 32. 500

of Associate country of Associate the service and to country and the service and to country mines of gold, filter, from and land, all which belong to the king, who, in consequence, at enjoying the produce, requires no taxes from his people. They have also great quantities of gum lac, and coarle filk. It is also thought that the inhabitants of Azem were long ago the inventors of cannon and gunpowder; and that from them the invention passed to the inhabitants of Pegu, and from thence to the Chinese.

AZIMUTH, in aftronomy, an arch of the horizon, intercepted between the meridian of the place and the azimuth, or vertical circle passing through the centre Vol. II. Part II.

of the object, which is equal to the angle of the ze- Azimut nith, formed by the meridian and vertical circle : or it is found by this proportion-As the radius to the tangent of the latitude of the place, fo is the tangent of the fun's or flar's altitude, for inflance, to the cofine or the azimuth from the fouth, at the time of the

Magnetical Azimura, an arch of the horizon intercepted between the azimuth, or vertical circle, passing through the centre of any heavenly body and the maynetical meridian. This is found by observing the object with an azimuth compate.

Arisavra compate in inflamment for finding either the magnetical arisavith or amplitude of a heavenly object.

object. The surgest invented fome time fince a ghs, invented fome time fince a series from the fall fest compals, which is at present the fall fest compals, which is at present the strength of the fall will be described under the string Clear Ass. This infrument, with the following the fall of the fall o

bispels is in a condition to be made use of in the bismacle; when the weather is moderate; but if the fer runs high, as the inner box is hung very free upso its centre (the better to answer its other purpofes), it will be necessary to flacken the milled nut. placed upon one of the axes that support the ring, and to lighten the nut on the outlide that corresponds to it. By this means, the inner box and ring will be lifted up from the edges, upon which they rell, when free; and the friction will be increased, and that to tions which otherwise would be occasioned by the motion of the fkip.

Somake the compals useful in taking the magnetic thoughth or amplitude of the fun and stars, as also the bearings of headlands, ships, and other objects at a diflance, the brais edge, deligned at first to support the gord, and throw the weight thereof as near the cirmander of as possible, is itself divided into degrees and halves; which may be easily divided into smaller of markets if excellary. The divisions are determined a cargut line, stretched perpendicularly that he was near the brass edge as may be, that the markets are from a different position of the observations from a different position of the observations in the card are two small weights, sliding the card are two small weights, sliding as placed at right angles to each other;

oyed nearer to, or farther from, the the dipping of the card in difthe dipping of the card in difthe candibrium of it, where
the means to be got too much out
the main aided an index at the top of the inner

boxy which may be put on and taken off at pleasure; and serves for all situdes of the object. It confils of a bar, equal in length to the diameter of the inner box, each end being furnished with a perpendicular stile, with a flit parallel to the fides thereof; one of the flits is narrow, to which the eye is applied ; and the other is wider with a small catgut stretched up the middle of it, and from thence continued horizontally from the top of one file to the top of the other. There is also

aximuth a line drawn along the upper surface of the bar. These four, viz. the narrow slit, the horizontal cat-gut thread, the perpendicular one, and the line on the bar, are in the same plane, which disposes itself perpendicular to the horizon, when the inner box is at reft, and hangs free. This index does not move round, but is always placed on, so as to answer the same fide of the box.

When the fun's azimuth is defired, and his rays are firong enough to cast a shadow, turn about the wooden box, till the shadow of the horizontal thread, or (if the fun be too low) till that of the perpendicular thread, in one flile, or the light through the flit on the other, falls upon the line in the index bar, or vibrates to an equal distance on each side of it, gently, touching the box, if it vibrates too far t observe, at the fame time, the degree marked upon the brais edge by the catgut line. In counting the degree for the waimuth, or any other angle that is reckoned from the meridian, make use of the outward circle in figures upon the brais edge; and the fituation of the index bar, with regard to the card and needle, will always direct upon what quarter of the compals the object

But if the fun does not fhine out fufficiently frome. place the eye behind the narrow flit in one of the Liles, and turn the wooden box about, till some part of the horizontal or perpendicular thread appears to interfect the centre of the fun, or vibrate to an equal diftance on each fide of it, using smoked glass next the eye, if the fun's light is too ftrong. In this method, another observer will be generally necessary, to note the degree cut by the nonius, at the fame time that the full gives notice that the thread appears to.

fplit the object.

From what has been faid, the other observations will be eatily performed: only, in case of the sun's amplitude, take care to number the degree by the help of the inner circle of figures on the card, which are the complements of the outer to 90"; and, confequently, thow the distance from east to west.

The azimuth of the flars may allo be observed by night; a proper light ferving equally for one objectives to fee the thread, and the other the degree upon the

card.

It may not be amils to remark farther, that in cale the inner box should lose its equilibrium, and, conto quently, the index be out of the plane of a vertical curcle, an accurate observation may full be made, provided the fun's shadow is distinct; for by observing first with one end of the index towards the last then the other, a mean of the two shierrattens will be the truth.

Plate LXXVII. is a peripective view of the pals, when in order for observation the party of view being the centre of the card, and the diffince of the eye two feet. AB is the wooden box. C and D are two milled nuts; by meims whereof the axis of the inner box and ring are taken from their edges on which they move, and the friction increased, when specessary. EF is the ring that supports the inner box. GH is the inner box; and I is one of its axes, by which it is suspended on the ring EF. The magnet or needle appears passing through the centre, together with a small brace of ivory, that confines the cap to its

place. The card is a fingle varnished paper, reaching Azimusa as far as the outer circle of figures, which is a circle of thin brass; the edge whereof is turned down at right angles to the plane of the card, to make it more stiff. O is a catgut line, drawn down the infide of the box, for determining the degree upon the brass edge. PQRS is the index bar, with its two fliles and catgut threads; which being taken off from the top of the box, is placed in two pieces, T and V, notched properly to receive it. W is a place, cut out in the wood, ferving as a handle.

AZIMUTH Circles, called also azimuths, or vertical circles, are great circles of the sphere intersecting each other in the zenith and nadir, and cutting the horizon at right angles. These azimuths are represented by the rhumbs on common fea charts, and on the globe they are represented by the quadrant of altitude, when screwed in the zenith. On these azimuths is reckoned the height of the flars and of the fun when not in the

meridian.

AZMER, a town of the East Indies in the domimone of the Great Mogul, capital of a province of the fame name, with a very firong caffle. It is pretty large, and a foreign spile in the Mogul himself.

AZOTUS, Azotu, or Asuson, one of the five vicies of the Philiflines, and a celebrated fea port on the Mediterranean, fituated about 14 or 15 miles fouth of Ekron, between that and Ascalon. It was in this city that the idol Dagon fell down before the ark; and fo strong a place it was, if we may believe Herodotus, that it fullained a fiege of 20 years by Planmeticus king of Egypt. It was, however, taken by the Maccabees in a much shorter time; who burnt both city and temple, and with them about 8000 men. The town is now called by the Arabs Hafaneyun. It is but thinly inhabited, though the fitua-

Azvenous.

Agure. tion is very pleasant : with regard to the houses, those that were built in the time of Christianity, and which are now inhabited by Mahometans, still preserve some claim to admination; but the modern buildings, though generally of stone, have nothing in them which can attract the notice of travellers. The streets are pretty broad, the inhabitants mostly Mahometans, with a few Christians of the Greek communion, who have a church under the jurifdiction of the archbishop of Gaza. The town is about a mile and a half in circumference; and has in it a mosque, a public bath, a market place, and two inns. The number of the inhabitants is between two and three thousand. The most remarkable thing in this place is an old structure with fine marble pillars, which the inhabitants fay was the house that Sampson pulled down; and to the foutheast, just out of the town, the water in which the eumuch Candace was baptized by the apostle Philip: befides these two, there are several ancient buildings with capitals and pillars standing.

AZURE, in a general lense, the blue colour of the fky. See Sky and BLUE.

Azure, among painters. This word, which at present fignifies in general a fine blue colour, was formerly appropriated to look levels, called grant live, and to the blue prepared in the first fluck a blue has been extracted from the pullom has applied to it the name of several levels a differa confiderably has been extracted from the million that applied to it the name of a second research to differs, considerably from the formation in management to differs, considerably from the formation and attended to be painting in oil. The fatters are present a called lasts being of only lasts; and the boar girls made from it for painting in oil, is called accommon.—The name axis is generally applied to the blue gives made from the carth of cohalt and virtinable mustices. The painting has been cally when it is reduced to a last painting between kinds of because are drift against a last painting to its legister of facility in the management of the management. the by the manes of the

and azure of four fires. In general, the more intense the colour, and the finer the powder, the more beautiful and dear it is. Azure is employed to colour starch; hence it has also been called flarch blue. It is used for painting with colours, and for a blue

AZURE, in heraldry, the blue colour in the arms of any person below the rank of a baron. In the escutcheon of a nobleman, it is called fapphire; and in that of a fovereign prince, Jupiter. In engraving, this colour is expressed by lines or strokes drawn horizontally. -This colour may fignify Justice, Perseverence, and Vigilance; but according to G. Leigh, if it is compounded with

> Cheerfulness. Vigilance. Readiness. Ver. Enterprise. Pur. Goodness. Sab. Mournfulnefs.

French heralds, M. Upton, and his followers, rank this colour before gules.

AZYGOS, in anatomy, a vein rifing within the thorax, on the right fide, having no fellow on the left; whence it is called azygos, or wenn fine pari.

AZYMITES, in church history, Christians who administer the eucharith with unleavened bread. The word is formed from the Greek a priv. and Zoun ferment. This appellation is given to the Latin by the Greek church, because the members of the former use fermented bread in the celebration of the eucharitt. They also call the Armenians' and Maronites by the fame name, and for the fame reason.

AZYMOUS, fomething unfermented, or made without leaven; as unleavened bread. Sea bisket is of this kind; and therefore, according to Galen, lefs wholesome than bread that has been fermented.

THE second letter of the English and most other alphabets. It is the first confonant, and first mute, and in its pronunciation is supposed to refemble the bleating of a theep; upon which account Pierius tells us in his hieroglyphics, that the Egyptians represented the found of this letter by the figure of chat animal.

B is also one of those letters which the eastern grammarians call labial, because the principal organs employed in its pronunciation are the lips. It is pronounced by preffing the whole length of them together, and forcing them open with a strong breath. It has a near affinity with the other labials P and V, and is often used for P both by the Armenians and other orientals, as in Betrus for Petrus, apfens for abfens, &c. ; and by the Romans for V, as in amabit for amavity

whence arose that jest of Aurelian on the emperor Bonolus, Non ut vivat natus eft,

Plutarch phierves, that the Maccdonians changed o into he and pronounced Bilip, Berenice, &c. for Philip, Phenenice, &c.; and those of Delphos wied B infread of it, Subur, for mubur, Binger for minger, &c.—The Latins said suppose, oppose, for subpose, ob-pose; and pronounced optimit, though they wrote obtinuit, as Quintilian has observed.—They also used B for F or PH: thus, in an ancient infeription mentioned by Gruter, OBRENDARIO is used for OFREN-

As a numeral, B was used by the Greeks and Hebrews to denote 2; but among the Romans for 300; and with a dash over it (thus B) for 3000.

Baal.

" Antiquit.

Lib. VIII.

cap. 7.

B is also used as an abbreviation. Thus B. A. stands for bachelor of arts; B. L. for bachelor of laws; and B. D. for bachelor of divinity. B. F. in the preface to the decrees or fenatus-confulta of the old Romans fignified bonum factum. In music, B stands for the tone above A; as Bb, or bB, does for B flat, or the femitone major above A. B also stands for bass; and B. C. for baffo continuo, or thorough bafs.

BAAL, the same as BEL, or BELUS; an idol of the Chaldeans, and Phoenicians or Canaanites. The former worshipped Mars under this name, according to Josephus *; who, speaking of Thurus the successor of Ninus, fays, " To this Mars the Affyrians erected the first statue, and worshipped him as a god, calling him Baal." It is probable the Phoenicians worthipped the fun under the name of Baal; for Johan, willing to make forme amends for the wickedness of Minasten, in worshipping Baal, and all the host of heaven per to death the idolatrous priefls that burnt merufe unto Baul, to the fun, and to the moon, and to the planets, and to all the bost of heaven. He likewise took away the barfes; that the kings of Judah had given to the fun, and burnt : † 2 Kings the chariots of the fun with fire †.

xxiii. 5. 11. The temples confecrated to this god, are called in:

thus: Hear us, whether thou art a god ar a goddels.

Some leatned menthink, that the Bad of the Mannicians is the Saturn of the Greeks; which is presented enough from the conformity them is between the has man facrifices offered to Saturn and those which the Scripture tells us were offered to Bask Others are of opinion, that Baal was the Phoenician of Syram Hercules, a god of great antiquity in Thunicia.

BAAL-BERITH, the god of the Shechemites. chart conjectures, that Berith is the same as Beree, the daughter of and Adonis, who was given in marriage to Baccara, and that she gave her name to the city of Berith in Phoenicia, and became afterwards the goddels of it. Baal-berith fignifies Lord of the covenunt, and may be taken for the god who prelides over alliances and oaths, in like manner as the Greeks had their Zivs eguiss, and the Romans their Deus Fidius, or

Jupiter Pislius. The idolatrous Israelites, we are told, made Baal-berith their god, Judg. viii. 33.

BAAL-TFOR, Baal-phegor, or Beel-phegor, an idol of the Moabites and Midianites. We are told, that Ifrael joined himfelf to Baal-peor; and that Solomon creeted an altar to this idol upon the Mount of Olives. Baal-peor has been supposed to be no other than a Priapus, and that the worship of him consisted in the most obscene practices. Others have thought, that as Baal is a general name fignifying Lord, Peor may be the name of fome great prince deified after his death. Mede imagines, that Peor being the name of a mountain in the country of Moab, on which the temple of Bual was built, Baal-peor may be only another name of that deity, taken from the fituation of his temple; in like manner as Jupiter is flyled Olympius, because he was worthipped in a temple built on Mount Olympus. Selden, who is of this latter opinion, conjectures likewise, that Baal-peor is the same with Pluto; which he grounds upon these words of the Psalmist . Psalm evil They joined themselves unto Bual-peor, and eat the offerings of the dand sthough by the facrifices or offerings of the dand on this pallage, may be meant no more than facrifices or offerings made to idols, or falle gods, who

the chariots of the fun with fire \(\frac{1}{2} \). The temples confecrated to this god, are called in the Scripture Chamaim, which figuifies places sacisfied with walls in which was kept a perpetual fire. Maundrell, in his journey from Aleppo to Jerusalem, observed fome traces of these enclosures in Syria. In most of them were no statues; in a few there were some, but of no uniform figure.

The word baal (in the Punic language), signifies ford or masser; and doubtless meant the supreme Deity, with the name of some false god, as Baal-berith, Basser, Bass

try, appears indisputably from Scripture; but that it was exactly in the fame place is what cannot be proved. nor is it a matter of any confequence.

Authors have been much divided about the motive by which the whole race of mankind were induced to join as one man in fuch an undertaking. Some have imagined that it was out of fear of a fecond deluge : others, that they knew beforehand that they were to be difperfed through all the different countries of the world. and built this tower in order to defeat the delign; of the Deity, because having a tower of such vast. height as they proposed, those who were at a distance could eafily find their way back again. Had either of these been their design, however, it is probable they would have chosen an eminence rather than a plain for

Babel.

Babel. the fituation of their tower, or indeed that they would have chosen some high mountain such as Avarat for their mark, rather than any tower at all for though it is faid that they deligned the top of their tower to reach to heaven, we can fearce suppose them to have been so absurd, as to imagine this possible in the fense we understand it, and must therefore rather take it in the limited lenfe in which it is often used by Moles and his countrymen, where they speak of cities walled up to heaven. Others there are who imagine that the top of this tower was not to reach up to heaven, but to be confecrated to the heavens, I e to the worship of the fun, moon, and state, of the fire, air, &c. and other natural powers as deities; and therefore that the true Deity interpoled in order to prevent a total and irrecoverable defection. Certain it is, that the species of rdolatry which takes for the objects of its worthin those natural agents, as it is the most ancient, so it is by far the most rational, and the most difficult to be disproved. It is much more difficult, for infrance, to prove that the fun, which by its enlivening beams gives vigour to the whole creation, is not a deity, than that a log of wood is not one: and hence if fuch a tythem of willwood is not one; and hence it tuch a typem of sellgion became universally chabithed among spainkings it
would be impossible ever afterwards to typedicate it.
Indeed that the scheme of Babel, windered in was,
could have been mustally attake Deity on the occafion; for seignal and a state of the Poity on the occafion; for seignal and a state of the would have worked a stignal as a second state of the would have worked a stignal as a second state of the would have so seen the second state of the the power High was no lefs than compositi ramines high. Even St Jerome affirms from the teltimony of eye, when ele, who, as he lays, had examined the remains of the tower, that it was four miles high ; but Ado makes the height to have been no less than 5000 miles. The only account of us dimensions which can be at all depended upon (Supposing it to have been the same which afterwards stood in the midst of the city of Babylon, and round which Nebucl adnezzar built the temple of Belus), is that given under the ar-

ticle BABYLON. BABEL-MANDEL, the GATI OF MOURNING; & famous firsit in the Indian ocean, between the coast of Arabia Febr in Asia, and that of Adel and Zeila in Africa, at the entrance into the Red sea. By some it is also called the Straits of Moka. It is narrow, and difficult to fail through, on account of the fund banks.

At the mouth of the strait is a small island called also Biberhan-Babel-Mandel, which is little elfe than a barren tock. E. Long. 44. 30. N. Lat. 12. 40. Bahington.

BABENHAUSLN, a town of Germany in Suabia.

E. Long. 9. 16. N. Lat. 48. 39.

BABINA (Commonwealth of), a fociety ludicroufly fo called, which was founded in Poland in the reign of Sigismund Augustus, in the 16th century. It took its rife from a fet of gentlemen, inhabitants of Lublin, who had agreed to meet at a place called Babina, merely for the purposes of mirth and jollity. In time their number increased, and they formed themiclyes into a regular government, under the prefidency of a king, fenate, and chief magistrates. The magistrates were elected from fomething which appeared ridiculous in the character or conduct of any of the members. For inflance, if any person was meddling or officious, he was faunediately created an archbishop, a blundering or disputations member was promoted to the speaker's chair; a boafter of his own courage, and vaingiorious Thrafo, was honoured with the commillion of generalifanio, which was presented him with great ceremony by the subordinate heroes. Those who declined the office for which they were declared qualified were perfecuted with hiffings, and abandoned by the fociety. Thus every vice and every foible was attacked with ridicule; and Babina became in a short time the terror, the admiration, and the reformer, of the Polich nation: genius flourished, wit was cultivated, and the abuses which had crept into government and society were corrected by the judicious application of good humoured fatire. Never did any inflitution of this nature become fo general or fo ufeful, but at length it degenerated into a fet of buffoons, and banterers of every thing facred or profane. For feveral years it was patronized by the kings of Poland, and Signimund himself became a member, the fluofluof Babina telling him jocularly, That, " His maretty had certain qualities which entitled him to the first dignity in the commonwealth." Not the least remnant of the fociety now remains, though it was honoured with extraordinary privileges by kings and emperois.

BABINGTON (Gervalc), bishop of Worcester, was born, according to Fuller, in Nottinghamshire, but in what year is uncertain. He was fent to I'ilbity College, Cambridge, of which he was made fellow; and in 1578, was incorporated mafter of arts at Oxthe sympara, however, to have made Cambridge present the seal being now doctor in divinity, was made the linguaplain to Henry earl of Pembroke. In this hasian he is apposed to have affisted the countes in her translation of the Fielms. In 1588 he was inftalled precioned of First order and in 1591 confecrated bishop of Landon. In 1594 he was translated to the see of Exetes, and thence to Worcester in 1597. About this time, or soon after, he was made queen's counsel. for the marshes of Wales." He was a considerable benefactor to the library belonging to the cathedral of Worcester, where he was buried in May 1610 without a monument. The feveral historians who have mentioned this prelate agree in giving lum the charafter of a learned and pious man. His writings, like those of most of his cotemporaries, abound with puns and quaint expressions. His works were printed both

Baboon, in folio and quarto in 1615, and again in folio in 1637, Babylon. under this title: The works of the right reverend father in God G reafe Bubington, late Bifbop of Worcefler, containing comfortable notes upon the five books of Mofis, viv. Genefis, &c. As also an exposition upon the Creed, the Ten Commandments, the Lord's Prayer; with a conference betweet man's frailtie and faith, and three fermons, &c.

BABOON, in zoology. See Simia.

BABYLON, the capital of the ancient kingdom of Babylonia or Chaldea, and supposed to have stood in: E. Long. 44. o. N. Lat. 32. o. Semiramis is said by fome, and Belus by others, to have founded this city. But, by whomfoever it was founded, Nebuchadnezzar was the person who put the last hand to it, and made it one of the wonders of the world. The most famous works m and about it were the walls of the city, the temple of Belus, Nebuchadnezzar's palace, the hanging gardens, the banks of the river, the artificial lake, and canals.

City de-Acribed.

The city was furrounded with walls, in thickness 87. feet, in height 350 feet, and in compals 480 ferlougs or 60 of our miles. Thus Herodotus, who was himfelf at Babylon; and though some disagree with him in thefe dimensions, yet most writers give us the same, or near the same, as he does. Diodorus Siculus diminishes the circumference of these walls very confiderably, and takes fomewhat from the height of them, as in Herodotus; though he feems to add to their breadth by faying, that fix chariots might drive abreaft thereons while the former writes, that one chariot only might turn upon them; but then he places buildings on each fide of the top of these walls, which, according to him, were but one flory high; which may pretty well reconcile them together in this respect. It is observed, that those who give the height of these walls but at 50 cubits, speak of them only as they were after the time of Darius Hystaspis, who had caused them to be bearen down to that level. These walls formed an exact square, each fide of which was 120 furlongs, or 15 miles, in length; and were all built of large bricks cemented together with bitumen, which in a short time grows harder than the very brick and stone which it cements. The city was encompassed, without the walls, with a vast. ditch filled with water, and lined with bricks on both fides; and, as the earth that was dug out of it lerved! to make the bricks, we may judge of the depth and largeness of the ditch from the beight and thickness of the walls. In the whole compais of the wall there wert 100 gates, that is, 25 on each of the four littles, all made of folid brafs. Between every two of thele gates. at proper distances, were three towers, and four more at the four corners of this great fourre, and three hetween each of these corners and the next gate on sither fide, and each of these towers was ten feet higher than. the walls. But this is to be understood only of those parts of the walls where towers were needful for defence. For some parts of them being upon a morals, and inaccessible by an enemy, there the labour and cost was spared, which, though it must have spoiled the symmetry of the whole, much be allowed to have favoured of good economy; though that is what one would not have expected from a prince who had been to determined, as Nebuchadnezzar must have been, to make the city complete both for ftrength and beauty. The

whole number, then, of these towers amounted to no Babylon more than 250; whereas a much greater number would. have been necessary to have made the uniformity complete all round. From the 25 gates on each fide of this fquare, there was a flraight fireet, extending to the corresponding gate in the opposite wall; whence the whole number of the fireets must have been but 50; but then they were each about 15 miles long, 25 of them croffing the other 25 exactly at right angles. Besides these whole streets, we must reckon four half streets, which were but rows of houses facing the four inner sides of the walls. These four half flicets were properly the four f.des of the city within the walls, and were each of them 200 feet broad, the whole streets being about 150 of the same. By this intersection of the 50 streets, the city was divided into 676 squares, each of four furlongs and a half on each fide, or two miles and a quarter in compals. Round these squares on every side towards the streets, stood the houses, all of three or four flories in height, and beautified with all manner of ornaments, and the space within each of these squares was all wold, and taken up by yards, or gardens, and the like, either for pleasure or convenience.

A branch of the Euphrates divided the city into two, ranging through the midft of it, from north to two, ranging through the midd of it, from north to fouth it over which, in the very middle of the city, was a bridge, a furloug in length, or rather more, and indeed much more, if we benefic to different who fay it was no lefs than five fladia or believed the chough but 30 foet broad, a different state with other bread, a different state with the best to decide. This bridge, therefore a take it force bread of this bridge were two palaces: the old palace on the sail falls like over two palaces: the old palace on the sail falls like over two palaces: the old palace on the sail falls like over two palaces: the old palace on the sail falls like over two palaces: the old palace on the sail falls like over two palaces: the old palace on the sail falls like over two palaces: the old palace on the former of which to the sails of the fall palace, such up another as the fall fall fall to the sail fall of fourti , over which, is the very middle of the city, was

this new one should rather exceed it; and that it was in order to fill it with inhabitants, that he reasported Inch numbers of the captives from other countries hither; though that is what may be disputed, seeing he therein only followed the constant practice of the kings of Affyria, who thought this the most certain means of affuring their conquetts either to themselves or their posterity.

But it plainly appears, that it was never wholly in- Was neve habited; so that, even in the meridian of its glory, it fully peomay be compared with the flower of the field, whichipled flourishes to-day, and to-morrow is no more. It never had time to grow up to what Nebuchadnezzar visibly intended to have made it; for, Cyrus removing

the feat of the empire soon after to Shushan, Babylon - fell by degres to otter decay: yet it must be owned, that no country was better able to support so vast and populous a city, had it been completed up to its first defign. But so far was it from being finished according to its original defign, that, when Alexander came to Babylon, Q. Curtius tells us, " No more than 90 furlongs of it were then built:" which can be no otherwise understood than of so much in length; and, if we allow the breadth to be as much as the length (which is the utmost that can be allowed), it will follow, that no more than 8100 square furlongs were then built upon: but the whole space within the walls contained 14,400 square furlongs; and therefore there must have been 6300 square furlougs remaining unbuilt, which, Curtius tells us, were ploughed and fown. And, besides this, the houses were not contiguous, but . all built with a void space on each fide, between house and house.

The next great work of Nebuchadnezzar was the temple of Belus. The wonderful tower, however, that built many ages before; that, and the lamous tower of Babel, being, as is commonly supposed, one and the same fructure. This tower is said to have been composed of eight paramidal enes railed above one another, and by I trioddies full by lawy been for long in height. But a there is a maniguity in his expression, the first that a the miniguity in his expression, the mean triods is the miniguity in his expression. The district furposition, which is the more involved in the same as in the whole of they taken togeths. The district furposition, which is the more involved in the same as in the whole of they taken togeths. The district furposition, which is the more involved in the proposition of the same in the same and it is though it fell short of its breakth at the lamb by 2. The way to go up was by share on the same afternoon in the fortion in district in district in the cutton in the same and likely, that said between the first made that the made the triods in district in the portion of the proposition of the same as a soon action on every the same and the country of the cutton of the same and concentrations of the same according to the country of the proposition of crustoms of the same country when the cutton of the position of the regression is to be proposed to the position of crustoms of the regression in the whole of the position of the regression is to proposed the whole; and, in confidence was find, which excluded the whole; and, in confidence was find, which excluded the whole; and, in confidence was find, which excluded the whole; and, in confidence was small to the regression; it is supposed to the flood in the middle of it, was not his work, but was built many ages before; that, and the famous tower latity wherewith this city was to all appearance marked out. It is supposed, that this wall was equal to the Iquare of the city wherein it flood, and to is concluded to have been two miles and a half in circumferences In this wall were feveral gates leading into the temple, and all of folid brais; which it is thought may have been made out of the brazen fea, and brazen pillars, and other veffels and ornaments of the kind, which Nebuchadnezzar had transported from Jerusalem; for in this temple he is faid to have dedicated his spoils from that of Jerusalem.

In this temple were feveral images or idols of masty gold, and one of them, as we have seen, 40 feet in height; the same, as supposed, with that which Nebuchadnezzar confectated in the plains of Dura. For though this last is said to have been 60 cubits, or go feet high, these dimensions appear so incredible,

that it has been attempted to reconcile them into Babylon. one, by supposing, that in the 90 feet the height of the pedestal is included, and that the 40 feet are for the height of the statue without the pedestal; and, being said to have weighed 1000 talents of Babylon, it is thence computed, that it was worth three millions and a half of our money. In a word, the whole weight of the statues and decorations, in Diodorus Siculus, amounting to 5000 and odd talents in gold, the whole is estimated at above one and twenty millions of our money; and a sum about equal to the same, in treasure, utensils, and ornaments, not mentioned, is allowed for.

Next to this temple, on the east fide of the river, stood the old palace of the kings of Babylon, being four miles in circumference. Exactly opposite to it, on the other fide of the river, was the new palace built by Nabuchadnezzar, eight miles in circumference, and consequently four times as big as the old one.

But nothing was more wonderful at Babylon than Hanging the histing gardens, which Nebuchadnezzar made in gardens. and retaining a strong inclination for the mountains and forests of her own country, was defirous of having fomething like them at Babylon. They are faid to have contained a square of four plethra, or 400 feet, on each fide; and to have confifted of terraces one shove another, carried up to the height of the wall of the city, the alcent from terrace to terrace being by fteps ten feet wide. The whole pile confifted of fub-Auntial arches upon arches, and was strengthened by a wall furrounding it on every fide, 22 feet thick; and the floors on each of them were laid in this order; first, on the tops of the arches was laid a bed or pavement of stones 16 feet long, and four feet broad; over this was a layer of reed mixed with a great quantity of bitumen; and over this two courses of brick, closely cemented together with plafter; and over all these were thick sheets of lead, and on these the earth or mould of the garden. This floorage was defigned to retain the mailture of the mould; which was fo deep, as to give root to the greatest trees which were planted upon every terrace, together with great variety of other vegetables pleating to the eye. Upon the uppermost of thele terraces was a refervoir, supplied by a certain engine with water from the river, from whence the garness on the other terraces were supplied.

The stirre works attributed to Nebuchadnezzar by Banksoftle. Specific and Atydenus, were the banks of the river, river, cathe artificial canals, and the great artificial lake faid nals, &c. to have been fails by Semiramis. The canals were cut out on the east lide of the Euphrates, to convey the waters of the street, when it overflowed its banks, into the Thrie, before they reached Babylon. The lake was on the well fide of Babylon; and, according to the layerst computation, 40 miles square, 160 in compals, and in depth 37 feet, as we read in Herodotus, or 75; as Megasthenes will have it; the former, perhaps, measured from the surface of the sides, and the latter from the tops of the banks that were cast up upon them. This lake was dug to receive the waters of the river, while the banks were building on each side of it. But both the lake, and the canal which led to it, were preserved after that work was completed, being found of great use, not only to pre-

Babylon, vent all overflowings, but to keep water all the year, as in a common refervoir, to be let out, on proper occafions, by sluices, for the improvement of the land.

The banks were built of brick and bitumen, on both fides of the river, to keep it within its channel; and extended on each fide throughout the whole length of the city, and even farther, according to some, who reckon they extended 160 furlongs, or twenty miles; whence it is concluded they must have begun two miles and a half above the city, and have been continued an equal distance below it, the length of the city being no more than 15 miles. Within the city they were built from the bottom of the river; and of the same thickness with the walls of the city itself. Opposite. to each fireet, on either fide of the river, was a brazen gate in the faid well, with flairs leading down from it to the river : thefe gates were open by day and thist by night.

Berofus, Megasthenes, and Abydenus, attribute all these works to Nebuchaduezzar; but literodown relle us, the bridge, the banks, and the lake, ware the work of a queen after him, called Nitotrie, who may have finished what Nebuchadnezzar left imperfect, and thence have had the honour this historian gives her of

the whole.

The tower or temple flood till the time of Kerkes. But that prince, on his return from the Grecian expedition, having first plundered it of its immense wealth, demolithed the whole, and laid it in ruins. Alexander, on his return to Babylon from his Indian expedition, proposed to rebuild it, and accordingly set 10,000 men to work to clear away the rubbish. But this death happening foon after, a ftop was put to all further proceedings in that defign. After the death of that conqueror, the city of Babylon began to decline apace; which was chiefly owing to the neighbourhood of Seleucia, built by Selenous Nicator, as is faid, out of spite to the Babylonians, and peopled with 500,000 persons drawn from Babylon, which by that means continued declining till the very people of the country were at a loss to tell where it had flood.

Such is the description we have by ancient historians of the grandeur of this city; which, if these accounts are not exaggerated, must have exceeded every piece of human grandeur that hath yet appeared. Many of the moderns, however, are of opinion that thele magnificent. descriptions are very far from being true; although it is certain that few other arguments can be brought against the reality of them, than that we do not lee things of a fimilar kind executed in our own days. The following are the arguments used on this labilet by the

president Goguet.

" Authors have greatly extolled the mill works arguments and edifices which once rendered Babylon one of the sgainfi the wonders of the world. We may reduce all these obtruth of the jects to five principal heads: 1. The height of its walls; 2. the temple of Belus; 3. the hanging gardens; 4 the bridge built over the river Euphrates, and the quays which lined that rivers the lake and canals dug by the hand of man to diffribute the waters of the Euphrates.

hat these works, so marvellous in the judgment of hat have been extremely exag-min by the authors who have spoke of them. How the we conceive, in effect, that the walls of Babylon

could have been 318 feet high, and 81 in thickness, in Babylon

a compais of near ten leagues?

" I shall fay the same of that square building, known under the name of the temple of Belus. It was composed of eight towers placed one above another, diminishing always as they went up. Herodotus does not tell us what was the height of this monument. Diodorus fays, that it surpassed all belief. Strabo fixes it to one stadium, a measure which answers nearly to 600 of our feet. For in the time of this geographer the stadia were much more considerable than in the first ages. The entire mass of this building ought to have been answerable to its excessive height; and this is also the idea that the ancients deligned to give us of it. We may judge by the following fact. Xerxes had entirely demolished this temple. Alexander undertook to rebuild it. He deligned to begin by clearing the place and removing the ruins. Ten thousand workmen who were employed two months in this work, were not, fax they, able to finish it.

"The righes enclosed in the temple of Belus were proportioned to its immensity. Without speaking of the portugate to the constant other facred vales, of many gain these many factors the constant other facred vales, of many gain these many factors. In the constant to the factors that the maintain have given us of the richer contained by the decimal distribution of the richer contained by the many factors that the many factors and a half of French livres. Less the many factors themselves. themfelies.

" Let us now speak of the bridge of Babyists, which the ancients have placed in the number of the most mayorelious works of the calt. It was near 100 fathous in length, and almost four in breadth. We cannot deny but that a great deal of art and labour was neceffary to lay the foundations, which it could not be eafy to fettle in the bed of an extremely deep and rapid river, which also rolls along a prodigious quantity of mud, and whose bottom is entirely fandy. They had therefore taken many precautious to fecure the piers of the bridge of Babylon. They were built of stones joined and faltened together with cramps of fron, and their joints filled with melted lead. The front of the piers, turned towards the current of the Euphrates,

Goguer's foregoing relation.

Babylon, was defended by buttreffes extremely advanced, which Babylonia diminished the weight and force of the water, by cutting it at a great distance. Such was the bridge of

Babylon.

"While we do justice to the skill of the Babylonians in conducting thefe works, we cannot help remarking the bad tafte which at all times reigned in the works of the eastern nations. The bridge of Babylon furnishes a ftriking inflance of it. This edifice was absolutely without grace, or any air of majefty. The breadth of it was in no fort of proportion to its length. The distance between the piers was also very ill contrived. They were distant from each other only IT feet and a half. Finally, This bridge was not arched. We may judge of its effect on the view.

"The Babylonians, however, were not the only people who were ignorant of the art of turning an urch. This fecret, as far as I can find, was unknown to all the people of remote antiquity, who, generally speaking, do not appear to have been very stilful in

" As for the quays which lined the Euphystes, we may believe that they were grand and magnificent: but I shall not easily believe that they fur passed those which we have duily under our spec. In this raspect, 1 believe Paris may dispute it for magnificence, and for the extent of the mark with all the cities of the privarially series.

for the extent of the middle with all the esses of the univers.

The most probable account of the matter is this: The empire of Affyria was touch ed by Pul, on the ruins of that of Damateus or System in the days of Memhem king of Judah. This less left two fons, Tiglath-Pilefer, and Nabonaffer. the former he bequeathed the empire of Affyria, and to the latter that of Babylon. Tiglath-Pilefer relided at Ninevels, the original feat of the Affyrian empire; while Nabonasser, who was the younger brother, held his refidence at Babylon. As the two kingdoms were governed by princes of the same family, we may well suppose a perfect harmony to have reigned between them, the younger branch at Babylon acknowledging a kind of subjection to the elder at Nineveh. That the Vot. II. Part II.

Babylonian empire was of Affyrian origin, we are af. Babylonia. fured by the prophet Isaiah, in the following words: " Behold the land of the Chaldeans: this people was not till the Assyrian founded it for them that dwelt in the wilderness; they set up the towers thereof; they built the palace thereof." As to the kingdom of Affyria, the Scripture mentions only five kings, viz. Pul, Tiglath-Pileser, Shalmaneser, Sennacherib, and Esarhaddon; whose history, as related by the facred writers. it is needless to mention particularly here. From the days of Nabonasser to Nabopolasser, that is, from the year before Christ, 727 to 626, the kings of Babylon made no figure, and were therefore probably in a state of dependance on the kings of Affyria; but at that time, in the reign of Chyniladan, the Sardanapalus of the Greeks, Minevels was taken and destroyed by the Medes and Babylonians, and the feat of the empire transferred to Babylon. This Nabopolasser was the father of the famous Nebuchadnezzar, for whose history We must refer to the facred writers : and from his time to that of the Belfbuzzar of Daniel, and Nabonadius of other authors, the history of Babylon is little better then a mere blank. Of the reduction of Babylon by Cyrus, which happened at this time, we have the following account :

War had been begun betwixt the Medes, Persians, and Babylonians, in the reign of Nerigliffar the father of Nabonadius, which had been carried on with very bad fuccess on the fide of the Babylonians. Cyrus, who commanded the Median and Perlian army, having fubdued the feveral nations inhabiting the great continent from the Ægean sea to the Euphrates, bent his march towards Babylon. Nabonadius, hearing of his march, immediately advanced against him with an army. In the engagement which enfued, the Babylonians were defeated; and the king, retreating to his metropolis, was blocked up and choicly befieged by Cyrus. The reduction of this city was no easy enterprise. The walls were of a prodigious height, the number of men to defend them very great, and the place flored with all forts of provisions for 20 years. Cyrus, despairing of being able to take such a city by form, caused a line of circumvallation to be drawn quite round it, with a large and deep ditch; reckoning, that if all communication with the country were cut off, the belieged would be obliged to furrender through famine. That His troops might not be too much fatigued, he divided the troops might not be too much fatigued, he divided the troops might not be too much fatigued, he divided the month for grant the trenches; but the belieged, looking upon frealistic to be out of all danger by reafon of their tight walk and magazines, infulted him from the spanies and looking upon all the trouble he gave himself and magazines have.

After Cyrus find front two whole years before Bubyion, without making any progress in the fiege, he at it the held of the following firstagen, which put him in pollettion of it. He was informed, that a great anmust followinty was to be held at Babylon : and that the inhabitants on that peciation were accultomed to spend the whole night in drinking and debauchery. This he therefore thought a proper time for furpriling them; and accordingly fent a throng detachment to the head of the canel leading to the great lake, with orders, at a certain time, to break down the great bank which was between the lake and the canal, and to turn the

4 X

Babylonia, whole current into the lake. At the same time he appointed one body of troops at the place where the river entered the city, and another where it came out; ordering them to march in by the bed of the river as foon as they should find it fordable. Towards the evening he opened the head of the trenches on both fides the river above the city, that the water might discharge itfelf into them; by which means, and the breaking down of the great dam, the river was foon drained. Then the two above-mentioned bodies of troops, according to their orders, entered the channel; the one commanded by Gobryas and the other by Gadates : and finding the gates all left open by reason of the diforders of that riotous night, they penetrated into the very heart of the city without opposition; and meeting according to agreement, at the palace, they furprifed the guards, and cut them in pieces. Thore who were in the palace opening the gates to know the cause of this confusion, the Persians rathed it, took the palace, and killed the king, who came out to meet them fword in hand. Thus an end was put tothe Babylonian empire; and Cyrus took position of Babylon for one called in Scripture Davis the Mede, most probably Cyanares II. uncle to Cyrus, I From this time Babylonia never was erected into a diftinct kingdom, but hath always followed the fortune of those great conquerors who at different times have appeared in Afia. It is now frequently the object of contention between the Turks and Perlians. See As-SYRIA.

Concerning the nature of the country, manners, cuftoms, &c. of the ancient Babylonians, the following

account is collected by M. Sabbathier.

" As all the nations under the dominion of Cyrus, befide the ordinary tributes, were obliged to maintainhim and his army; the monarch and his troops were Supported by all Asia. The country of Babylon slone was obliged to maintain him four months of the year sits fertility, therefore, yielded a third of the produceof Alia. The government of this country, which the Persians termed fairapy, was richer and more extenfive than any of the reft. It maintained for the kings. besides the war horses, a stud of 800 stallions, and 16,000 mares. So great a number of Indian dogs were likewife bred in this province for the king, that four of its cities kept those animals and in returns they were exempted from all taxes and tributes.

to Herodotus. The earth was watered by the which was here diffused by human indultar and the Nile is over Egypt by nature; for all the country of Babylon was divided by canals, the present of shirt was navigable, and flowed from loved to part. the Euphrates to the Tigris. Is then, it was one the fineit countries for corn in the world; but for producing trees, the figures, the vine, and the chire, it was not famous. It was o luxuriant in grain, that it commonly yielded a hundred times more than what was fown; and in its good years it rielded three hundred times more than it received. The leaves of its wheat and bailey were four inches broad. 'Though I kne Leys Herodotus, that the millet and the fefactountry grow to the fize of trees, I will not be them particularly; left those who have not been Babylonia (hould think my account fabulous."

"They had no oil but what they made from Indian Babylonis. corn. The country abounded with palm trees, which grew spontaneously; and most of them bore fruit, of which the inhabitants made bread, wine, and honey, They cultivated these trees and their fig-trees in the same manner. Some of them, as of other trees, the Greeks called male ones. They tied the fruit of the male to the trees which bore dates; that the mosquito, leaving the male, might cause the date to ripen, by penetrating it; for without that ailiftance it came not to maturity. Mosquitos bred in the male palms as in the wild fig-trees.

"But we must not here omit to give an account of the peculiar and furpriling construction of their boats of fkins, in which they failed along the river to Babylon. Thele boats were invented by the Armenians, whose country lay north from Babylonia. They made. them with poles of willow, which they bent, and covered with fkins: the bare fide of the fkins they put outwards ; and they made them to tight, that they refembled boards. The boats had neither prow nor ftern,. but were at a going form like a buckler. They put firmer on the Sottom. Two, men, each with an oar, rowed them dien the river, bulen with different wares, but filters with pain-wine. Of these boats some were very surge, southern with pain-wine. Of these boats some were very surge, southern with some transfer carried the weight at some southern southern an as in one of their simple and the surge, one when the arrival at Babylon, they do not southern the surger southern and the surger southern the surger southern the surger southern southern southern the surger southern the su made these locates of Street indicates a separation on their rections of presents and particle rections to the service of presents and seed that the product the service or their sections of the product of the product

Land of the control o

The state of the s ries in the first fold the most beautiful one. When seemed fold her at an immeric price, he put up others to fale, according to their degrees of beauty. The rich dely logious were similars to carry off the first wo med, who were fold to the highest bidders. But as the young men who were poor could not aspire to have fine women, they were content to take the uglieft with the money which was given them : for when the crier had fold the handsomest, he ordered the ugliest of all the women to be brought; and alked, if any one was willing to take her with a finall fum of money. Thus the became the wife of him who was most callly fatisfied; and thus the finest women were fold; and from the

Babylonia money which they brought, small fortunes were given Babylonian to the uglieft, and to those who had any bodily infirmity. A father could not marry his daughter as he pleased; nor was he who bought her allowed to take her home, without giving fecurity that he would marry her. But, after the fale, if the parties were not agreeable to each other, the law enjoined that the

purchase-money should be restored. The inhabitants of any of their towns were permitted to marry wives at these auctions. Such were the early customs of the

Babylonians.

"But they afterwards made a law, which prohibited the inhabitants of different towns to intermater and by which husbands were punished for treating their wives ill. When they had become poor by the rum of their metropolis, fathers used to profittute their daughts ters for gain. There was a fentible coftom among the Dabylonians, worthy to be related. They prought their fick into the forum, to confire these are on their diseases; for they had a belief the fame difference of the fame difference of the fame difference of the fame difference of the fame of the way that the fame difference of the fame of the way that they every one who law to the fame of the fame of the way that they every one who law to the fame of the fame of

BACCARACH, a town of Germany in the Lower Palatinate: formerly imperial and free, but now fubjust to the elector Palatine. It is famous for excellent wine; and is fituated on the Rhine, in E. Long. 7. 5. N. Lat. 49. 57.

BACCIIAE, in antiquity, the priestesses of Bacchus, who celebrated the orgia, or mysteries of that god. The word was also used for the ivy crowns or garlands worn by the priests of Bacchus, in offering facrifices to him.

BACCHANALIA, feafts celebrated in honour of Bacchus by the ancients. The two most remarkable were called the greater and leffer. The latter, called lenea, from a word lignifying a wine-press, were held in the open fields about autumn; the greater, called Dionyfia, from one of the names of Bacchus, were exlebrated in the city, about the spring time. Both these fealls were accompanied with games, spectacles, and theatrical representations; and it was at this time the poets contended for the prize of poetry. Thate who were initiated into the celebration of thele feath, reprefented, fome Silenus; others, Pan; othersie Batters, and in this manner appeared in public, night and tay counterfeiting drunkennels, dancing objection, and committing all kinds of licenticulness and haronic See the article BACCHUS.

BACCHARIS, PLOPORISM A ASTRONOMY AND THE PARTY AND ASTRONOMY AND ASTRONOMY AND ASTRONOMY AND ASTRONOMY AND ASTRONOMY time florers mixed with the hormaphradite ones. There are feven species, all natives of warm climates; but none of them merit notice except the two following: 1. The. ivafolia, or African tree groundles, is, a native of the Cape of Good Hope, as allo of Peru and other warm pasts of America. It grows to the height of five or fix tect; and though there is little beauty in the flower, has been long admitted into the gardens of the curious. is is presty hardy, and will live abroad in moderate winters in England, but is usually kept in green-houses,

and placed abroad only in fummer. It may be propagated either by cuttings or by feeds, which ripen well in this country. 2. The halimifolia, or Virginia groundfel tree, is a native of Virginia and other parts of North America. It grows about seven or eight feet high, with a crooked thrubby frem; and flowers in October: the flowers are white, and not very beautiful; but the leaves continuing green, has occasioned this shrub to be admitted into many curious gardens. It may be propagated by cuttings; and will live very well in the open air, though severe frost will sometimes deftroy it.

BACCHI, in mechanics, a kind of ancient machines, in form of goats, used by Jupiter, in his wars against the giants. Rudbeck describes two kinds of bacchi, one made like the battering ram, wherewith Jupiter demolished the enemy's fortifications; the other contrived to call fire out of, from whence the Greeke are conjectured to have framed their idea of

in beather mysbidogra, six gas with a hode labulous adventures a very lighter in the perforage is foldow through infullify; but he was regarded in a more respectable light: by the ancients, who worthipped him in different countries under the following appellations: in Egypt, he. was called Oficis; in Mylin, Fanacen; in India, Dionyfius; Liber, throughout the Roman dominions; Ardoneus, in Arabia; and Pentheus, by the Lucaniane Mythologists furnish reasons for all these different names. given to the fame god, which may be feen in the fecond volume of Banier's Mythology. and.

It is natural to suppose that the Greeks and Romans, as usual, bestowed upon the one Bacchus which they

Bacchi Bacchue Bacchus, worthipped, the feveral actions and attributes of the many divinities known by that name, and by other equivalent denominations in different countries. However, antiquity chiefly diftinguished two gods under the title of Bacchus; that of Egypt, the fon of Ammon, and the same as Ofiris; and that of Thebes in Borotia, the fon of Jupiter and Semele.

The Egyptian Bacchus was brought up at Nyfa, a city of Arabia Felix, whence he acquired the name of Dionyfius, or the god of Nyla; and this was the conqueror of India. Though this Bacchus of the Egyptians was one of the elder gods of Egypt, yet the fon of Semele was the youngest of the Grecian deities. Diodorus Siculus tells us, that Orpheus first deified the fon of Semele by the name of Bacchus, and appointed his ceremonies in Greece, in order to render the family of Cadmus, the grandfather of the Grecian Bacchus, illustrious.

The great Bacchus, according to Sir Hase Newton, The great Bacchus, according to our mass previous, flourished but one generation before the argumentation. This Bacchus, says Flourished to the production of the same and the same and the same and poetry there. And according to James and poetry there. And according to James and same the for a same that for a same that for a same than a same ich ginaciaps as

climed to language with fines. Indeed we see selfhedicale, inflictuted by the society to the bacons memory of this prince of bon weather, malie was the gotten, as may be fill gathered from ancient feuiptairs, where we find not only that mulicians, male and female, reguled him with the tyre, the flute, and with fung; but that he was ancompanied by fawns and fatyre play? ing upon timbrels, cymbals, bagpipes, and borns: the appellations of Bacchi, Sileni, Satyre, Bacche, Le-, Thya, Mamillones, Naindes, Nymphe, and Tityri. These representations have furnished subjects for the finely remains of ancient foulpture; and the most voluptuous passages of ancient poetry are descriptions of Bacchy the orgies and festivals of Bacchus. See ORGIA.

BACCHYLIDES, a famous Greek poet, was the Bachelor. nephew of Simonides, and the cotemporary and rival, of Pindar. Both fung the victories of Hiero at the public games. Besides odes to athletic victors, he was author of Love Verses; Prosodies; Dithryambics; Hymns; Pæans; Hyporchemes; Parthenia, or fongs to be fung by a charus of virgins at festivals. The chronology of Eusebine places the birth of Bacchylides in the 82d Olympiad, about 450 B. C.

BACCIO, or BACCING, (Andrew), a celebrated phylician of the toth century, born at St Elpideo. He precitied physic at Rome with great reputation, and was hell physician to Pope Sixtus V. The most feure and usuable of his works are, 1. De Thermis.
2. De Name all Vinorum Historia. 3. De Venenis et An-

Beccio (Pres. Bertulomeo), called Bartelemi di S. Marte, a reliebrated painter of history and portrait, the bern at Savignano near Florence in 1469, and was a disciple of Cosumo Roselli; but his principal knowledge in the art of painting was derived from Leonardo da Vinci. He understood the true principles of delign better than most masters of his time, and was also a confiderable painter in perspective; which induced Raphael to have recourse to him after he had quitted the school of Perugino; and under his direction likewife Raphael studied the art of managing and naiting colours, as well as the rules of perspective. Some years after the departure of Raphael from Flosence, Baccio visited Rome; and by the observations he made on the antiques, and the works of Raphael which were then the admiration of the whole world, he was extremely improved, and manifested his acquired abilities by a picture of S. Sebaltian, which he finished at his return to Florence. It was so well delighed, to naturally and beautifully coloured, and had fo firong an expression of pain and agony, that it was removed from the place where it was pubhicky feen (in the chapel of a convent), as it had bein observed to have made too strong an impresfrom an the imaginations of many women who beheld in the imagnations of many women who beheld in the person very laborious, and made nature his person that a creat deal of grace, and his colouring was hid a creat deal of grace, and his colouring was hid to invect the first included a layman by the artists, as the second to the person by the artists, as the second to the person by the category to there with greater exacttheir more elegant folds. Adornson by Baccio is in the Adornson by Baccio is in the Baccio is a Baccio is in the Baccio is a Baccio is a Baccio is in the Baccio is a Baccio is in a flat of cell-bery. The Bonan ordinar frequently imposed fines on old bachtlors. Dien Hallourusfieus mentions an old scallitution, by which all perfore of full age were obliged to marty. But the most celebrated law of this kind, was that made under Augustus, called the lew Tulia de maritandis ordinibus; by which bachelors were made incapable of legacies or inheritances by will. unless from their near relations. This brought many to marry, according to Plutarch's observation, not so

Bachelor, much for the fake of raifing beirs to their own effates, as to make themselves capable of inheriting those of other men .- The rabbins maintain, that, by the laws of Moles, every body, except some few particulars, is obliged in confequence to marry at 20 years of age; this makes one of their 613 precepts. Hence those maxims fo frequent among their cafuilts, that he who does not take the necessary measures to leave heirs behind him. is not a man, but ought to be reputed a homicide.-Lycurgus was not more favourable; by his laws, bachelors are branded with infamy, excluded from all offices civil and military, and even from the flows and public iports. At certain feats they were facted to appear, to be exposed to the public decision, and led round the market place. At one of they feel, women led them in this conditions to be when they obliged them to make ground and the they accompanied with a number of plant and a rod at diferction. To complete the affirm, them to fing certain fongs composed in their or fion.—The Christian religion is more mattern to fing circumfances ancient church recommend in fone circumfances are found. in some circumstances prescrable to, and more perfect than, the matrimonial. In the canon law, we find injunctions on bachelors, when arrived at puberty, either to marry or to turn monks and profess chaffity in earneft .- In England, there was a tax on bachelors, after 25 years of age, 12l. 10s. for a duke, a common person 15. by 7 Will. III. 1695. In Britain, at prefent, they are taxed by an extra-duty on their fervants. Every. man of the age of 21 years and upwards, never having been married, who shall keep one male fervant or more, thall pay 11. 5s. for each above or in addition to the ore dinary duties leviable for servants. Every man of the age of 21 years and upwards, never having been married, keeping one female fervant, shall pay 26, 66. in addition to the former 2s. 6d.; 5s. in addition for each, if he has two females fervants; and roe in addition for each for three or more female fervants.

BACHELOR, was unciently a denomination girents those who had attained to knighthood, but had a number of vallals sufficient to have their banner carried before them in the field of battle; or if they were not of the order of Bannerets, were not of age to offplay their own baimer, but obliged to march to buttle on their own banner, but obliged to march to hit leder another's banner. It was also a title riven to cavaliers, who, having made their fire campaigned to denominate him who had arreconstant to denominate him who had arreconstant tournament the first time he capable, in a military lende, is derive baccelarius, a kind of cavalir and an arreconstant to fissing of least the confission of a first, consisting of least the world players to the roof of their same world players to the roof of their same and the proof of their same world players to the roof of their same and their same arreconstant of the roof of their same arreconstant of the roof of their same arreconstant of their same arreconsta would plough; the possessor which which called bachelors. Calescense and Afrileira derive hayoung cavaliers exceeded themielves to fighting with staves. Martinina derives it from baccoloureus, i. c. bacsa laurea donaire, in allusion to the ancient custom of crossess poets with laurel, baccis lauri, as was the Petrarch at Rome in 1941. Alciat and of the same opinion: nor is this erymology

Knights-B icurrors, the most ancient, but the lowest Backelor. order of knights in England; known by the name of knights only. They are flyied knights-bachelors, either (according to fonce) as denoting their degree, quafi bas chevaliers; or, according to others, because this title does not descend to their posterity.

The custom of the ancient Germans was to give their young men a shield and a lance in the great council: this was equivalent to the toga virilis of the Romans. Before this, they were not permitted to bear arms, but were accounted as part of the father's household fafter it, as part of the public. Hence some derive the ulage of knighting, which has prevailed all from those northern heroes. Knights are called in Latin equite await; await, from the gilt spurs they wore and quites because they always served on horse-pack for it is indervable, that almost all nations call their served by some appellation derived from a life called in our law militar, because it indied the whole, of the royal with held a knight's see indicated to 201. see animals at the served the king. over the western world, since its reduction by colonies. money 1 though seriation sales (10) to besome burnelled of firmity of a particular of the sales of and three years in theology, and held two acts of examination in the Surbonne. Beckelors in the canon law are admitted after two years findy in the same, and fultaining an act according to the forms. A bachelor of physic must have studied two years in medicine, after having been four years mafter of arts in the university. and having flood an examination; after which helis invested with the fur, in order to be licensed. In the university of Paris, before the foundation of divinity professorships, those who had studied divinity fix years

Bachelors were admitted to go through their course, whence they were called baccalarii curfores; and as there were two courses, the first employed in explaining the Bible during three successive years, the second for explaining the master of the sentences for one year, those who were in the Bible course were called baccalarii Biblici. and those arrived at the sentences baccalarii sententia-

rii. And, lastly, Those who had gone through both were denominated baccalarii formati, or formed bachelers. At prefent, formed backelor denotes a person who

has taken the degree regularly after the due course of fludy and exercises required by the statutes; by way of opposition to a current bachelor, who is admitted in

the way of grace, or by diploma.

We also find mention of bachelors of the church, baccalarii ecclesia. The hishop with his canons and baccularii, cum consilio et consensu omnium canonicorum suorum

BACHELORS, in the livery companies of London, are those not yet admitted to the livery. These companies generally confift of a matter, two wardens, the livery, and the bachelors, who are yet, but in expecta-

livery, and the bachelors, who are yet, but in expectation of dignity in the company, and have their function only in attendance on the mafter and wardens.

BACK, BACK-Bone, OI SPINE. See Anatomy, No 36. Back, in the manege, and among farriers. A horle's back should be straight, not hollow, which is called faddle-backed: horses of this kind are generally light, and carry their heads high, but want in strength and fervice. A horse with a weak back is apt to stumble.

In the French riding schools, to mount a horse a dos, Backis to mount him bare-backed, without a faddle, gammon

BACK-Gammon, an ingenious game played with dice,

upon a table, by two persons.

Manner of playing the game. The table is divided into two parts, upon which there are 24 black and white spaces, called points. Each adversary has 15 men, black and white, to distinguish them; and they are disposed of in the following manner: Supposing the game to be played into the right hand table, two are placed upon the ace point in the adversary's table, five upon the fix point in the opposite table, three upon the cinque point in the hithermost table, and five on the fix point in the right hand table. The grand object in this game is for each player to bring the men round into his right hand table, by throwing with a pair of dice those throws that contribute towards it, and at the same time prevent the adversary doing the like. The first best throw upon the dice is esteemed aces, because it stops the fix point in the outer table, and secures the cinque in the thrower's table; whereby the advertary's two men upon the thrower's ace point cannot get out with either quatre, cinque, or fix. This throw is an advantage often given to the antagonist by the fuperior player.

When he carries his men home in order to lose no point, he is to carry the most distant man to his adverfary's bar point, that being the first stage he is to place it on; the next stage is fix points farther, viz. in the place where the adversary's five men are first placed out of his tables. He must go on in this method till all his men are brought home, except two. when by losing a point, he may often fave the gammon,

by throwing two fours or two fives.

When a hit is only played for, he should endeavour to gain either his own or adverfary's cinque point : and if that fails by his being hit by the advertury, and he finds him forwarder than himfelf, in that cafe he must throw more men into the adversary's tables; which is done in this manner: He must put a man upon his cinque or bar point; and if the adversary neglects to hit it, he may then gain a forward game iustead of a back game: but if the adversary hits him, he faculd play for a back game; and then the greater number of men which are taken up makes his game. the better, because by these means he will preserve his the at home; and then he should endeavour to gain the his advertices are and trois points, or his ace and trois points, or his ace and trois points, or his ace and trois points, that in case he hits him from the case, that point may remain still secure to the state of the point may remain still secure to the state of the point may remain still secure to the state of the state of

A part game thousand not be played for at the be-pressing of a let, because it would be a great disadvan-tage, the player rowning the risk of a gammon to win

Rules for playing it felling out all the throws on the dice, when she player is to play for a gammon or for a fingle bu (1). It wo note are to be played on the cinque point and bar point, for a gammon or for a hit. 2. Two fixes, to be played on the adverlary's

bar point and on the thrower's bar point, for a gamgammon. mon or for a hit. 3. † Two trois, to be played on the cinque point, and the other two on the trois point in his own tables, for a gammon only. 4. + Two deuces, to be played on the quatre point in his own tables, and two to be brought over from the five men placed in the adverfary's tables for a gammon only. 5. + Two fours, to be brought over from the five men placed in the adversary's tables, and to be put upon the cinque point in his own tables for a gammon only. 6. Two fives, to be brought over from the five men placed in the adverlary's tables, and to be put on the trois point in his own tables, for a gammon or for a hit. 7. Size ace, he must take his bar point for a gammon or for a hit. 8. Size dence, a man to be brought from the five men placed in the advertary's tables, and to be placed in the cinque point in his own tables, for a gammon or for a hit. 9. Six and three, a man to be brought from the adverlary's ace point, as far as he will go, for a gammon or for a hit. 10. Six and four a man to be brought from the adversary's ace point, as far as he will go, for a gammon or for a hit. 21. Six and five, a man to be carried from the adverfary's ace point, as far as he can go, for a gammon or for a hit. 12. Cinque and quatre, a man to be carried from the udversary's ace point, as far as he can go for a gammon or for a hit. 13. Cinque trois, to make the trois point in his table, for a gammon or for a hit. 14. Cinque dence, to play two men from the five placed in the adverlary's tables, for a gammon or for a hit. 15. † Cinque ace, to bring one man from the five placed in the adversary's tables for the cinque, and to play one man down on the cinque point in his own tables for the ace, for a gammon only. 16. Quatre trois, two men to be brought from the five place in the adverfary's tables, for a gammon or for a hit. 17. Quatre deace, to make the quatre point in his own tables, for a gammon or for a hit. 18. + Quatre ace, to play a man from the five placed in the adversary's tables for the quatre; and for the ace, to play a man down upon the cinque point in his own tables for a gammon only. 19. + Trois deuce, two men to be brought from the five placed in the adverfary's tables for a gammon only. 20. Trois ace, to make the cinque point in his own table, for a gammon or for a hit. 21. + Deuce ace, to play one man from the five men placed in the adverter ry's table for the deuce; and for the see to play a man n' down upon the cinque point in his own tables, for a gammon only. 22. Two trois, two of them to be played on the cinque point in his own tables, with the other two he is to take the quatre point in the adversary's tables. 23. * Two deuces, two of them are to be played on the quatre point in his own ratios, and with the other two he is to take the trois point in the adverfary's tables. By playing thefe two cases in this manner, the player avoids being that up in the advertary's tables, and has the chance of throwing out the tables to win the hit.

24. * Two fours, two of them are to take the adverlary's cinque point in the adverlary's tables, and for the other two, two men are to be brought from the five placed in the adversary's tables. 25. * Cinque ace, the cinque should be played from the five men placed in the adverfary's tables, and the ace from the adver- Backfary's ace point. 26. * Quatre acc, the quatre to be gammon. played from the five men placed in the adversary's ace point. 27. * Dence ace, the dence to be played from the five men placed in the advertary's tables, and the ace from the adverfary's ace point.

The three last chances are played in this manner; because an ace being laid down in the adversary's tables. there is a probability of throwing deuce ace, trois deuce, quatre trois, or fize cinque, in two or three throws; either of which throws secures a point, and

gives the player the best of the hit.

Cautions, &c. The player must understand by the directions given to play for a gammon, that he is to make some blots on purpose, the odds being in his fayour that they are not hit; but if it should happen that any blot is hit, as in this case there will be three men in the adverfary's tables, he must then endeavour to secure the adversary's cinque, quatre, or trois point, to prevent a gammon, and must be very cautious of his fourth mun's not being taken up.

He mult not crowd his game at any time if he can help it; that is to fay, he should not put many men either upon the trais or deuce points in his own tables, being the time as loting those men, not having them in being the fame se loting those men, not having them in play. gammon. liged to play otherwife.

It is the interest of the adversary to take up the player as foon as he enters. The blot should be left upon the adverlary's lowest point; that is to say, upon his deuce point, rather than upon his trois point; or upon his trois point rather than his quatre point; or upon his quatre point preferable to his cinque point, for a reason before mentioned; all the men the adverfary plays upon his trois, or his deuce points, are deemed loft, being greatly out of play; so that those men not having it in their power to make his cinque point, and his game being crowded in one place and open in another, the advertary mult be greatly annoy-'ed by the player.

If the player has two of the adverlary's men in his tables, he has a better chance for a hit than if he had more, provided his game is forwarder than that of his antagonit's; for if he had three or more of the adverfary's men in his tables, he would fland a worfe chance

to be hit. When a player is running to fave the gammon, if he should have two men upon his ace point, and several men abroad, although he should lose one point or two in putting his men into his tables, it is his interest to leave a man upon the adversary's ace point, because it will prevent his adversary from bearing his men to the greatest advantage, and at the same time the player will have a chance of the adversary's making a blot, which he may chance to hit. However, if a player finds upon a throw, that he has a probability of laving his gammon, he should never wait for a blot, as the odds are greatly against his hitting it, but should embrace that opportunity.

How to calculate the odds of faving or evinning the gammon. Suppose the adversary has so many men abroad as require three throws to put them into his tables, and at the fame time that the player's tables are made up, and that he has taken up one of the adverfary's men; in this case, it is about an equal wager that the adversary is gammoned. For in all probability the player has bore two men before he opens his tables, and when he bears the third man, he will be obliged to open his fize or cinque point. It is then probable, that the adversary is obliged to throw twice before he enters his men in the player's tables, twice more been fore he puts that man into his own tables, and three throws more to put the men which are abroad into his own tables, in all leven throws. Now the player have ing 12 men to bear, he may be forced to make a see or a deuce twice before he can bear all his men, and confiquently will require feven throws to hearing them. fo that, upon the whole, it is about equal whether the

adverfary is gar moned or not.
Suppose a proper has three men upon his adversary are point and five points in his own tables, and that the adversary has all his men in his tables, three upon each of his live highest points, Has the player a probability of gammoning his advertagy or not?

gammon.

Bringing his three men from the adverlary's ace point to his fize point in his own tables, being 18 points each, and making together

There must remain

Chin met

It is plain from this calculation, that the player has much the best of the probability of the gammon, exclusive of one or more blots which the advertary is li able to make in bearing his men, supposing at the fame time the throws to be upon an equality.

Suppose two blots are left, either of which cannot be hit but by double dice; one must be hit by throwing eight and the other by throwing nine; to that the advertary has only one die to hit either of them. What are the odds of hitting either of them?

The chances of two dice being in all The changes to hit & are 6 and a twice 5 and 3 twice 2 Deuces 2 Fours The chances to hit 9 at 1 5 And 4 twice 2 Trois

For hitting, in all Chapter for sect intellige. So that the odge has as either of the chapter.

or blots made to hit any of ther, and then the chances of game to be Nam tron his affective time point and his cites. Who has advective a description and B is to throw. Who has the bell of the bit - Answer of A has the bell of it gold to filver; because, if B does not throw an ace to against bies. A will take up B's men in his tables, ei ther fingly or to make points; and then if B lecure, either A's deuce or trois point, A will put as many men down as possible, in order to hit, and thereby ge a back game. It is evident that the back game i very powerful; consequently, whoever practifes it must become a greater proficient at the game than he could by any other meaus.

Another critical cafe. Suppose A to have five men placed upon his lize point, as many upon his quatr point, and the same number upon his deuce point, al in his own tables. At the same time, let us suppose B to have three men placed upon A's ace point as many upon A's trois point, and the same numbe

Back-

Staff.

upon A's cinque point, in his own tables, and three gammon men placed as usual out of his tables. Who has the best of the hit? - Answer: The game is equal, till B has gained his cinque and quatre points in his own tables; which if he can effect, and by playing two men from A's cinque point, in order to force his adversary to blot by throwing an ace, which should B hit, he will have the best of the hit.

> A case of curiosity and instruction; in which is shown the probability of making the hit last hy one of the players for many hours, although they shall both play as fail as usual .- Suppose B to have bore 13 men, and that A has his fifteen men in B's tables, viz. three men upon his lize point, as many upon his einque point, three upon his quarte point, the fame number upon his trois point, two upon his deuce point, and one upon his ace point. A in this fituation can prolong it, as aforefaid, by bringing his 15 men home, always fecuring fix close points till B has entered his two men, and brought them upon any certain point; as foon as B has gained that point, A will open an ace, dence, or trois point, or all of them ; which done B hits one of them, and A taking care to have two or targe men in B's tables, is ready to hit that man ; and also he being certain of taking up the other man, has if in his power

certain of taking up the other man, has if in his power to prolung the list direct to said length, provided he takes care not to depth what as two fours, two fives are two fours, two fives are two fours. It can be fived to open the ace, deuce, or fives are two fours in the five of the point of the five of the ace, deuce, or five one is a five of the five of the ace, deuce, or five of the five of the five of the ace, deuce, or five one is a five of the five of the ace, deuce, or five one is a five of the ace of the five of the case of the five of the fi from getting his man home, at which time he found calculate who has the belt of the hit. If he and the B is foremon, he should then try to lay fuch black a may be taken up by his adverlary, that he may have a chance of taking up another man, in case B should happen to have a blot at home.

Laws of Backgammon. 1. If a man is taken from any point, it must be played; if two men are taken from it, they also must be played. 2. A man is not supposed to be played till it is placed upon a point and quitted. 3. If a player has only fourteen men in play, there is no penalty inflicted, because by his playing with a leffer number than he is entitled to, he plays to a disadvantage for want of the deficient man to make up his tables. 4. If he bears any number of men before he has entered a man taken up, and which of course he was obliged to enter, such men so borne must

be entered again in the adverfary's tables as well as the man taken up. 5. If he has mistaken his throw and Punning, played it, and his adversary has thrown, it is not in the choice of either of the players to alter it, unless they both agree fo to do. .

Back-Painting, the method of painting mezzotinto prints, pasted on glass, with oil colours. See MEZZO-

TINTO.

The art confilts chiefly in laying the print upon a piece of crown glass, of such a fize as fits the print.

In order to do this, take your print, and lay it in clean water for two days and two nights, if the print be on very strong, close, and hard gummed paper; but if upon an open, fost, spongy paper, two hours will sometimes fuffice, or more, according as the paper is.

The paper or picture having been sufficiently loaked, take it out and lay it upon two sheets of paper, and cover it with two more; and let it lie there a little to

fuck out the moifture.

In the mean time, take the glass the picture is to be but upon, and fet it near the fire to warm; take Strafburg turpentine, warm it over the fire, till it is grown fluid, then with a hog's hair brush spread the turpentine very imoothly and evenly on the glass.

When this has been done, take the mezzotiato print from between the papers, and lay it upon the glafs; beginning first at one end, rubbing it down gently as you go on, till it lie close, and there be no wind blad-

ders between.

Then, with your fingers, rub or roll off the paper from the back fide of the print, till it looks black, i. c. till you can fee nothing but the print, like a thin film, left upon the glass, and fet it by to dry.

When it is dry, varnish it over with some white transparent varnish, that the print may be feen through it;

and then it is fit for painting.

The utmost care will be necessary in rubbing or rolling the paper of the print, so as not to tear it, especially in the light parts.

You may, instead of soaking your prints two days and two nights, roll them up and boil them for about two hours, more or less, according to the quality of the paper, in water; and that will render it as fit for rubbing,

rolling, or peeling, as the other way.

This being done, and your oil colours prepared, recend very fine, and tempered up very stiff, lay on the particular part requires; letting the mafter lines of the prior till fulle your pencil, and so each particular coglan, and look shoot as well as a painted piece, if it be done nearly.

The thadows of the print are generally sufficient for hadow of every colour; but if you have a mind the give a shadow by your pencil, then let the shadows be said on first, and the other colours afterward.

In laying on colours in this kind of back-painting. you need not be curious as to the laying them on This is not at all requifite here, where the chief aim is only to have the colours appear well on the fore fide of the print; and therefore the only care to be used of this work, is to lay the colours on thick enough, that its body may strike the colour of it plainly through the glass.

BACK-Staff, a name formerly given to a fea-quadrant

drant invented by Captain Davis: because the back of the artist is turned towards the sun at the time of observation. See QUADRANT.

B. C. Stays, of a ship, are ropes belonging to the main-mast and fore-mast, and the masts belonging to them; serving to keep them from pitching forwards or overboard.

BACK Tack, in Scots law: When a wadfetter, instead of possessing the wadset lands, grants a tack thereof to the reverser for payment of a certain sum in name of tack duty, that tack is called a back tack.

BACK Worm. See FILANDERS.

BACKER, or BAKKER, (Jaques), a painter of hiflory, was born at Antwerp in 1530; and learned the principles of painting from his father, who was an artill very knowing in his profession, though his works were in no great eltimation. After the death of his. father, he had in the house of Jacopo Palerme, a dealer in pictures, who avariciously took care to keep him incessantly employed, and feat his paintings to Paris to be disposed of, where they happened to be excordingly admired. The judicious were very eager to purchase them; and though the transactor fold them at a great price, yet the poor artist was not proportionably rewarded, but continued in the same obscure and depressed condition. His merit, indeed, was unirevially allowed but, his name, and the narrowness of his circumstances, were as universally unknown. He had a clean light manner of pencilling, and a tint of colour that was extremely agreeable.--i'le died in

BAKER, or BAKEIR, ((scob), painter of portrait and hillory, was born at Harlingen in 1609, but fpent the greatest part of his life at Amsterdam; and by all the writers on this fubject, he is mentioned as an extraordinary painter, particularly of portraits, which he executed with fireigth, fphit, and a graceful refemblance. He was remarkable for an uncommon readinels of hand and freedom of pencil; and his incredible expedition in his manner of painting, appeared even in one portrait of a lady from Haerlem, that he painted at half length, which was begun and finished in one day, though he adorned the figure with rich drapery and feveral ornamental jewels. He also painted historical subjects with good success; and in that style there as a fine picture of Cimon and Iphigenia, which is accounted by the connoisseurs an excellent performance. In deligning academy figures his expression was to just, and his outline to correct, that he obtained the princthem all his competitors; and his works are Rill bought, up at very high prices in the Low Countries, La the collection of the Elector Palatine there is an excellent head of Brouwer, painted by this mafter; and in the Carmelites church at Antwerp is preserved a capital picture of the Laft Judgment, which is well defigued and well coloured. He died in 1651.

BACKEREEI, called Bacqueselli, (William) a painter of history, was born at Antwerp, and was a disciple of Rubens, at the same sime that Vandyck was educated in that school. When each of them quitted that master, and commenced painters, Backetelmas very little inferior to Vandyck, if not near-equal. And this may be manifelly seen works of the former, which are in the school the Augustin monks at Antwerp; where

those two great artists painted in competition, and both were praised for their merit in their different ways; but the superiority was never determined in savour either of the one or the other. He had likewise a good tatle for poetry; but, by exercising that talent too freely, in writing satires against the Jesuits, these ecclesiastics pursued him with unremitted revenge, till they compelled him to fly from Antwerp; and by that means deprived his own country of such paintings as would have contributed to its perpetual honour.—Sandrart takes notice, that in his time there were seven or eight painters, who were very eminent, of the name of Backereel, in Italy and the Low Countries.

BACKHUYSEN (Ludolph), an eminent painter, was born at Embden in 1631, and received his earliest influction from Albert Van Everdingen; but acquired his principal knowledge by frequenting the painting rooms of different great mafters, and observing their various methods of: touching and colouring. One of these matters was Heavy Dubbels, whose understanding in his art was very extensive; and he was as remarkably communicative of his knowledge to others. From him Backbuyfen obtained more real benefit than from all the painters of his sime, either by fludying trom all the painters of his sime, either by fludying their works, or personally convening with them. His subjects were see pieces, hips, and see parts. He had not practised very long white the painters the children were sought after, and several of the wave benefits by at 100 stories apiece. It was a stress of min, that while he was painting, by white and father even his most intimate briefly to have a possible to have a confine to his father than the had formed in the might be defined and the little to the formed in the same to the same and the little to the same and fancy might be disturbed, and the sense he had formed in his mind be interrupted. He findled radius after-tively in all the findle of the control of the findle of the fin and dilmay; and the moment he landed he always in. patiently ron to his palette to secure those incidents, of which the traces might by delay be obliterated. He periodly understood the management of the chieron feuro, and by his skill in that part of his art, he gast uncommon force and beauty to his objects. He obferved firially the truth of perspective, in the distances of his veffels, the receding of the grounds on the shores, and the different buildings which he deferibed in the fea ports; whether they were the refult of his own imagination, or sketched, as he usually did, after nature. His works may eatily be diftinguished by an obfervant eye, from the freedom and neatness of his touch; from the clearness, and natural agitation or quiescence of the water; from a peculiar tint in his clouds and skies; and also from the exact proportions of his ships, and the gracefulness of their position. For the burgomasters of Amsterdam he painted a large picture, with a multitude of veffels, and a view of the

Backing city at a distance, for which they gave him thirteen hundred guilders, and a confiderable prefent; which picture they afterwards prefented to the king of France. who placed it in the Louvre. No painter was ever more honoured by the vifits of kings and princes than Backhuysen; the king of Prussia was one of the number; and the Czar Peter the Great took delight to fee him paint, and often endeavoured to draw after vellels which he had defigned. He was remarkably affiduous, and yet it feems aftenishing to consider the number of pictures which he finished, and the exquisite manner in which they are painted. He died in 1709.

BACKING, inhorfemanship. See Horsemanship. BACKING the Sails, in navigation; to arrange them in a fituation that will force the ship to retreat, or move backwards. This is, however, only done in narrow channels, when a thip is carried along fidewife by the tide or current, and wants to avoid any thing that may interrupt her progress, as thouls, vessels at anchor, &c. or in the line of battle, when a thip wants to be immediately opposite to another with which she is engaged.

BACKS, among dealers in leather, denote the thickest and best tanned hister, used chiefly for loses

of hoes.

Bacon (Roger), a Franciscan fries of american genius and learning, was born near Ilchefter in Somerletilire, in the year 1214. He began his fludies at Oxford; but in what school, or college is uncertains Thence he removed to the university of Paris, which in those times was effected the centre of literature. Here we are told, he made so rapid a progress in the sciences, that he was esteemed the glory of that university, and was much caressed by several of his countrymen, particularly by Robert Grouthead, afterwards bishop of Lincoln, his singular friend and patron. About the year 1240, he returned to Oxford; and assuming the Franciscan habit, prosecuted his favourite fludy of experimental philosophy, with unremitting

ardour and affiduity. In this pursuit, in experiments, Bacons instruments, and in scarce books, he tells us, he spent, in the space of 20 years, no less than 2000l.: which. it feems, was given him by some of the heads of the university, to enable him to profecute his noble inquiries. But fuch extraordinary talents, and aftonishing progress in sciences, which, in that ignorant age, were totally unknown to the rest of mankind, whilst they raifed the admiration of the more intelligent few, could not fail to excite the envy and malice of his illiterate finternity; who found no difficulty of possessing the vulgar with the notion of Bacon's dealing with the devil. Under this pretence, he was reftrained from reading lectures; his writings were confined to his convent; and finally, it 1278, he himself was imprisoned in his cell. At this sime he was 64 years of age. Neverthelefs, being permitted the use of his books, he went on in the rational purloit of knowledge, corrected his former labours, and wrate leveral curious pieces. When he had been to years in confinement, Jerom de Ascoli being elected pope, Bacon solicited his holiness to be released; in which it feems, he did not immediately fucceed. However, towards the latter end of that pope's reign, he obtained his liberty, and fpent the remainder of his life in the college of his order, where he died in the year 1204, in the 80th year of his age, and was buried in the Franciscan church. Such are the few particulars which the most diligent researches have been able to discover concerning this very great man; who, like a fingle bright flar in a dark hemifphere, shone forth the glory of his country, and the pride of human nature. His works are, 1. Epistola fratris Rogeri Baconis de secretis operibus artis et nature, et de nullitate magie. Paris, 1542, 4to. Balil, 1593, 8vo. 2. Unus majus. Lond. 1733, fol. published by Dr Jebb. 3. Thefaurus chemicur. Francf. 1603, 1620. This was probably the editor's title; but it contains several of our author's treatiles on this subject. These printed works of Bacon contain a confiderable number of effays, which, in the catalogue of his writings by Bale, Pits, &c. have been confidered as diffinct books; but there remain in different libraries feveral manufcripts not yet published. By an attentive perufal of his works, the reader will be aftonished to find, that this great luminary of the 13th the was a great linguist and a skilful grammarian; Therinative ; that he understood the use of convex and convex and the art of making them; that the convex and the art of making them; that the convex of the convex and the power of the convex and art of making the was well veried in group that and alternative; that he knew the great error in the saladard assigned the cause, and proposed that the he understood chronology well; that the remide, that he understood chronology well; What he was attaclost in chemistry, and was really the inventor of gurpowder; that he possessed great knowledge in the medical art; that he was an able mathematician, logician, metaphylinian, and theologist.

Bacon (Sir Nicholas), lord keeper of the great feal in the reign of Queen Elizabeth, was born at Chiffehurst, in Kent, in 15to, and educated at the univerfity of Cambridge; after which he travelled into France, and made some stay at Paris. On his return, he settled in Gray's Inn, and applied himfelf with such affiduity to the fludy of the law, that he quickly diflinguished

himfels

é .

Bacon. himself fo, that on the diffolution of the monastery of St Edmund's Bury, in Suffolk, he had a grant from King Henry VIII. in the 36th year of his reign, of feveral manors. In the 38th of the same king, he was promoted to the office of attorney in the court of wards, which was a place both of honour and profit. In this office he was continued by King Edward VI.: and in 1552 he was elected treasurer of Gray's Inn. His great moderation and confummate prudence preferved him through the dangerous reign of Queen Mary. In the very dawn of that of Elizabeth he was knighted; and on the 22d of December 1558, the great feal of England, being taken from Nicholas Heath archbishop of York, was delivered to him with the title of lord keeper, and he was also made one of the queeti's privy . council. He had a confiderable share in the settling of religion: as a statesman, he was remarkable for a clear head and deep counfels : but his great parts and high preferment were far from raising him in his own opinion, as appears from the modelt answer he gave Queen Elizabeth, when the told him his house at Redgrave was too little for him: " Not fo, Madam; (returned he); but your majefly has made me too great for my house." After having had the great feal more than 20 years, this able flatciman and faithful counfellor was fuddenly removed from this life, as Mr Mallet informs us, by the following accident: he was under the hands of the barber, and thinking the weather warm, had ordered a window before him to be thrown open, but fell afleep as the current of fresh air was blowing in upon him, and awakened fome time after distempered all over. He was immediately removed into his bedchamber, where he died a few days after, on the 26th of February 1578-9, equally lamented by the queen and her subjects. He was buried in St Paul's, where a monument was erected to him, which was deflroyed by the fire of London in 1666. Mr Granger observes, that he was the first lord keeper that ranked as lord chancellor; and that he had much of that penetrating genius, folidity, and judgment, persualive eloquence, and comprehensive knowledge of law and equity, which afterwards flione forth with fo great w luftre in his fon, who was as much inferior to his father in point of prudence and integrity as his father : was to him in literary accomplishments.

BACON (Francis), lord high chancellor of England under King James 1. was fon of Sir Nicholas Bicon lord keeper of the great feal in the reign of Queen Ell zabeth, by Anne daughter of Sir Anthony Code, eminent for her skill in the Latin and Greek rengular. He was born in 1560; and showed such market bearing. that he was particularly taken notice of by Queen Elizabeth when very young. He was educated at Trinity-college, Cambridge; and made fuch incredible progrefs in his fludies, that, before he was 16, he had not only run through the whole circle of the liberal arts as they were then taught, but began to perceive those im-perfections in the reigning philosophy, which he afterwards to effectually expoted; and thereby not only overturned that tyranny which prevented the progress of true knowledge, but laid the foundation of that free and meful philosophy which has fince opened a way to formany glorious discoveries. On his leaving the university, his father sent him to France; where, beforc he was 19 years of age, he wrote a general view

of the flate of Europe: but Sir Nicholas dying, he Baconi was obliged fuddenly to return to England; when he applied himfelf to the fludy of the common law, at Gray's Inn. At this period the famous earl of Effex, who could diftinguish merit, and who paffionately loved it, entered into an intimate friendship with him ! zealoufly attempted, though without fuccess, to procure him the office of queen's folicitor; and, in order to comfort his friend under the difappointment, conferred on him a prefent of land to the value of 1800l. Bacon, notwithstanding the friendship of so great & person; notwithstanding the number and power of his own relations; and, above all, notwithstanding the early prepossession of her majesty in his favour; met with many obstacles to his preferment during her reign. In particular, his enemies represented him as a speculative man, whose head was filled with philosophical notions, and therefore more likely to perplex than forward pubhic bulineful. It was not without great difficulty that lord treasurer Burleigh obtained for him the reverfion of register to the star-chamber, worth about 1500l. a-year, which place fell to him about 20 years after. Neicher did he obtain any other preferment all this reign sthough if obedience to a lovereign in what much be the most diagnosticle of all offices, viz. the this reign relativists of observed to a lovereign in what make the most disagreeable of all offices, viz. the calting reflections at a decembed friend, entitled him, he might have challed it. This people were so clamorous even against this when his all the death of Effex, that it was tunied the health of the death of Effex, that it was tunied the health of the administration. This was afficient the conduct of the administration. This was afficient to the back of his very life was threatened. This is noted in his very life was threatened. This is noted in his very life was threatened. This is noted in his was those reflect to dissinguish honors; and wrote in a was those reflect to dissinguish honors; and wrote in a was able to be said to the life of palionately defined. In this was a just the way of the was allowed the said the was about the culton of this was a secretarial. In this was a substituted that the was made to be included the was made to be included to the said to be included to the said to be partially and the said to be a said t the bell expedient for the king and people. In 1621, the was advanced to the dignity of Viscount St Albans, and appeared with the greatest splendour at the open-ing of the session of parliament. But he was soon after surprised with a melancholy reverse of fortune. For, shout the 12th of March, a committee of the house of course of justice. The first thing they fell upon was bribery and corruption, of which the lord chancellor was accused. For that very year complaints being made to the house of commons of his lordship's having received bribes, those complaints were fent up to the house of lords; and new ones being daily made of a like nature, things foon grew too high to be got over. The king found it was impossible to fave both his chancellor, who was openly accused of corruption, and Buckingham his favourite, who was fecretly and therefore more dangerously attacked as the encourager of whatever

Bacon.

whatever was deemed most illegal and oppressive: he therefore forced the former to abandon his defence. giving him politive advice to submit himself to his peers. and promiting upon his princely word to fcreen him in the last determination, or, if that could not be, to reward him afterwards with ample retribution of favour. The chancellor, though he forefaw his approaching ruin if he did not plead for himfelf, refolved to obey: and the house of peers, on the 3d of May 1621, gave judgment against him, " That he should be fined 40,000l. and remain prisoner in the Tower during the king's pleasure; that he should for ever be incapable of any office, place, or employment, in the state or commonwealth; and that he should never sit in parliament, or come within the verge of the court." The fault which, next to his ingratitude to Effex, thus tarnished the glory of, this illustrious man, is faid to have principally proceeded from his indulgence to his fervants. who made a corrupt use of it. One day, during his trial, passing through a room where several of his domeltics were fitting, upon their rifing up to falute him, he faid, " Sit down, my masters; your rife hath been my fall." Stephens, p. 54. And we are told by Ruffa-worth in his historical collections, "That he treasured up nothing for himself or family, but was over indulgent to his fervants, and connined at their takings, and their ways bettayed him to the error; they were profule and expended and him to the error; they were profule and expended and him their command whatever he was made and him their gifts taken were for the most pair to interlocuter and; his decrees were generally plade with a much aquity, that though gifts rendered him full pecked for injustice, yet never any decree made by him was reverted as unjust. It was peculiar to this great was lay the authors of the Biogra Brit.) to have nothing narrow and felfile in his composition; he gave away without contains whatever he policified, and believing other actually the hame goods, he received with a little of the first and the first and the first and he is there is her improvement. Some the last much against his states are the last of an additional and the first one, which he also as we have a made on a first year of King Charles. He arrived in our the last the first, and he was a first year of his life he devoted wholly to his studies. In his receive the composition was a first year of his life he devoted wholly to his studies. In his receive the composition was a state of the composition of the composition of the life he devoted wholly to his studies. In his receive the composition was a state of the composition of the c and their ways betrayed him to that error; they were devoted wholly to his fludies. In his receis he come. posed the greatest part of his English and Latin morks. He expired on the 9th of April 1626; and was buried. in St Michael's church at St Albans, according to the direction of his last will, where a monument of white. marble was crected to him by Sir Thomas Meautys, formerly his fecretary, and afterward clerk of the privy council under two kings. A complete edition of this great man's works was published at London in the year 1740 .- Addison has said of him, That he had the found, distinct, comprehensive knowledge of Aristotle, with all the beautiful light graces and embellishments of Cicero. The honourable Mr Walpole calls him the Prophet of Arts which Newton was afterwards to reveal; and adds, that his genius and his works will be univerfally admired as long as science exists. "As long as ingratitude and adulation are despicable, so long shall we lament the depravity of this great man's heart. Alas! that he who could command immortal

fame, should have stooped to the little ambition of Bacon power."

Bacon Bactria.

Bacon (Sir Nathaniel), knight of the Bath, and an excellent painter, was a younger fon of the lord keeper, and half brother to the great Sir Francis. He travelled into Italy, and studied painting there; but his manner and colouring approaches nearer to the style of the Flemish school. Mr Walpole observes, that at Culford, where he lived, are preserved some of his works; and at Gorhambury, his father's seat, is a large picture by him in oil, of a cookmaid with a dead sowl, admirably painted, with great nature, neathers, and lustre of colouring. In the same house is a whole length of him, by himself, drawing on a paper, his sword and pallet hung up, and a half length of his mother by him.

BACONTHORP (John), called the refulute dollar, a learned monk, was born towards the end of the 13th century, at Baconthorp a village in Norfolk. He fpent the early part of his life in the convent of Blackney, near Wallingham in the same county; whence he removed to Oxford, and from thence to Paris; where being distinguished for his learning, he obtained degrees in divinity and laws, and was effeemed the principal of the Averroifts". In 1329 he returned to England, See Aver and was immediately chosen twelfth provincial of the rees. English Carmelites. In 1333 he was sent for to Rome; where, we are told, he first maintained the pope's sovereign authority in cases of divorce, but that he afterwards retracted his opinion. He died in London in the year 1346. Leland, Bale, and Pits, unanimously give him the character of a monk of genius and learning. He wrote, I. Commentaria feu quessiones Super quatuor libros fententiarum; and, 2. Compendium legis Christi, et quodlibeta: both which underwent feyeral editions at Paris, Milan, and Cremona. Leland, Bale, and Pits, mention a number of his works never published.

BACTRIA, or BACTRIANA, now Chorussan of Khorasan, an ancient kingdom of Asia, bounded on the west by Margiana, on the north by the river Oxus, on the south by Mount Paropismus, and on the east by the Asiatic Scythia and the country of the Massagetz. It was a large, fruitful, and well-peopled country, containing according to Ammianus Marcellings 1000 cities, though of these only a few are particularly mentioned by historians, of which that formarily called Maracanda, now Samarcand, is the most considerable.

Of the littery of this country we know but little. Authors agree that it was fubdued first by the Assyrians, afterwards by Cyrus, and then by Alexander the Great. Afterwards it remained subject to Selencus Nicator and his fuccessors till the time of Antiochus Theoa; when Theodotus, from governor of that province, became king, and firengthened himfelf fo effectually in his kingdom, while Antiochus was engaged in a war with Ptolemy Philadelphus king of Egypt, that he could never afterwards dispossess him of his acquisitions. His posterity continued to enjoy the kingdom for fome time, till they were driven out by the Scythians, who reigned in Bactria in the time of A. drian, Antoninus Pius, &c. The Scythians were in their turn driven out by the Huns or Turks, and thefe often conquered by the Saracens and Tartars; never-

Baden.

Badajoz.

Bactrope- thelefs they continued in possession of this country in the time of Ladislaus IV. king of Hungary.

In early times the Bactrians differed little in their manners from the Nomades; and being near neighbours of the Scythians, who were a very warlike people, the Bactrian foldiers were reckoned the best in the world. Their appearance was very favage; being of an enormous stature, having a terrible aspect, rough beards, and long hair hanging down their shoulders. Some authors affert that they kept dogs on purpose to devour fuch as arrived at extreme old age, or who were exhausted by long sickness. They add, that for all their fierceness, the Bactrian hulbands were such dupes to their wives, that they durft not complain of them even for conjugal infidelity, to which it leems the latter were very much addicted.

BACTROPERATA, an ancient appellation given to philosophers by way of contempt, denoting a man with a flaff and a budget.

We suppose it is of the same people that Esuchesias Radbertus speaks under the corrupt name of Baccoperita, or Bacchionita, whom he describes as philosophers who had fo great a contempt for all earthly things, that they kept nothing but a diffi to drink out of; and that one of this order feeing a peafant feeoping up the water in his hand, threw away his cup as a superfluity: which is nothing but the old flory of Diogenes the Cynic.

BACULE, in fortification, a kind of portcullis, or gate, made like a pitfall with a counterpoife, and supported by two great stakes. It is usually made before the corpade-guard, not far from the gate of a

BACULOMETRY, the art of measuring accessible or inacceffible heights, by the help of one or more baculi, flaves, or rods. See Geometry.

BACURIUS, or BATURIUS, king of the Iberians, a people on the fide of the Caspian sea. One day being a-hunting, he loft fight of his company, through a great florm and fudden darkness; upon which he vowed to the God of his Christian slave, that if he were delivered he would worship him alone: the day breaking up immediately, he made good his promife, and became the apostle of his country.

BADAGSHAN, a very ancient city of Great Bukharia, in the province of Balkh, fituated at the foot of those high mountains which separate Indologia from Great Tartary. The city is exceedingly ftrong by its fituation; and belongs to the khan of Proper Bakha-ria, who uses it as a kind of state-prison to secure those he is jealous of. The town is not very big but well built, and very populous. It hands on the storth firle of the river Amu, about 100 miles from its fource; and is a great thoroughfare for the caravam defigued for Little Bukharia. The inhabitants are entiched by naives of gold, filver, and rabies, which are in the neighbourhood; and those who live at the foot of the mountains gather a great quantity of gold and filver dust brought down in the fpring by torrents occasioned by the melting of the fnow on the top.

BADAJOZ, a large and strong town, capital of Estremadura in Spain. It is situated on the river Guadiana, over which there is a fine bridge built by the Ramans. On this bridge the Portuguele were defeated

in 1661, by Don John of Austria. W. Lon- 7. q. Badelom N. Lat. 38. 39

BADELONA, a town of Catalonia in Spain, feated on the Mediterranean. Lord Peterborough landed here in 1704, when, with Charles then king of Spain, he laid fiege to Barcelona, from which it is ten miles diftant. E. Long. s. 20. N. Lat. 41. 12.

BADEN (the diffrict of), in Swifferland has three cities, Baden, Keisers Stoul, and Klingnaw, besides a town that passes for a city, namely, Zurzach. It is one of the finest countries in Swifferland; and is watered with three navigable rivers, the Limmet, Rufs, and Are. The land is fertile in corn and fruit, and there are places on the fides of the Limmet which produce wine. It maintains a communication between the cantons of Zurich and Bern, being feated between their north extremities. It extends on one fide to the Are, as far as the place where it falls into the Rhine, and on the other fide beyond the Rhine, where there are forme villages which depend thereon. Most of the inhabitants are Papills. By the treaty of peace at the conclusion of the war which broke out in 1712 between the Protestant and Popish contons, this country was yielded to the Pretellant camons of Zurich and Bern. Before, it was the imports of the eight old cantons; however, as the expense of Charle had taken no part in this war, by the postlest of both parties its right was still continued.

this continued.

BADAN, the capital of the americal density interests in a percentile city, indefentely larger fairing quarter in a plain danked by two larger fairing services which the river runs. The control of the Christian era. Several manuscripts of materials like Christian era. Several manuscripts of materials like Christian era. Several manuscripts of materials like the been found here from which to this, post crimby like been found here from which to this, post crimby like been found here from which the post crimby like been found here from which the larger post crimby like been found here one of forests and here post crimbs and father and here post crimbs. The larger post of the larger place heliadors of foreign powers are leated on one lide to the right, and the deputies of the other cantons are ranged on each fide the room. The bailiff of Baten refider in a castle at the end of a handforme wooden bridge, which is covered in. Before this caftle there is a floor pillar, erected in honour of the emperor Trajan, who paved a road in this country 85 Italian miles in length. The inhabitants are rigid Roman catholics, and formerly behaved in a most infolent manner to the Protestants, but they are now obliged by their masters to be more submiffive. The baths which are on each fide the river are a quarter of a league from the city. Joining to the small baths there is a village, and to the large a town which may pass for a second Baden. It is feated on a hill, of which the afcent is fleep. There the baths are brought into mns and private houses, by

means of pipes, which are about 60 in all. There are also public baths in the middle of the town, from a fpring which rifes in the ffreet, where the poor bathe gratis, but they are exposed quite naked to all that pass by. All the baths are hot, and one to fo great a degree as to scald the hand; and they are impregnated with a great deal of fulphur, with fome alum and nitre. They are useful for drinking as well as bathing; and are faid to cure all diseases from a cold cause, headaches, vertigoes, &c. They strengthen the senses, cure diseases of the breast and howels, althmas, and obstructions. They are peculiarly excellent for women's diseases. E. Long. 8. 25. N. Lat. 4". 27.

BADEN (the Margravate of), in the circle of Swabia, in Germany, is bounded by the Palatinate of the Rhine, on the north; by the Black Forest, on the east; by Switzerland, on the fouth; and by the Rhine, which divides it from Alface, on the cast : and leabout 90 miles in length, from north to fouth; but not above 20 in breadth, where it is widelt. It is a very populous and fruitful country, abounding in porn and wine. Venison and wildfowl are to plentiful, that they are the common diet of the pessants. The rivers that water this territory, are the Rhines Kins, Wireshes, and Phints, which yield plents of fell. They feed their hogs with chefnuts, which each the bacon excellent. They have freelione for building independent of all colours. They have freelione for building independent of all colours. They have for superior the plant quantities of hemp and the for superior the The chief towns are Baden, Durisces Freelion. See that. Gerbach, Propheiut, and Hadding

43. 0. BATTENOCH, the most casterly part of Invernels-Mire, in Spotland, extending about 33 miles in length from east to welt, and 27 from north-east to fouth-welt where broadest. It has no considerable town, and is very barren and hilly, but abounds with deer, and other kinds of game.

BADEN weller, a town of Germany, belonging to the lower margravate of Baden. E. Long. 7. 50. N. Lat. 47. 55.

BADENS (Francis), historical and portrait painter, was born at Antwerp in 1571; and the first rudiments of the art were communicated to him by his father, who was but an ordinary artift. However, he xifited Rome, and feveral parts of Italy, and there Vol. II. Part II.

formed a good talle of delign, and a manner exceed- Badge ingly pleasing. When he returned to his own country his merit procured for him great employment, and still greater reputation, and he was usually diffinguished by the name of the Italian painter. His touch was light and spirited, and his colouring warm; and he had the honour of being the first who introduced a good taste of colouring among his countrymen. While his acknowledged merit was rewarded with every public testimony of esteem and applause, unhappily he received an account of the death of his brother, who had been affallinated on a journey; and this intelligence affected him to violently, that it occasioned his own death, to the inexprehible regret of every lover of the art, in 16034

BADGE, in naval architecture, fignifies a fort of ornament, placed on the outfide of imail flips, very near the ftern, containing either a window for the corvenience of the cabin, or a representation of it. It is commonly decorated with marine figures, martial inftruments, or such like emblems.

· BADGER, in zoology, the English name of a species of urfus. See Unsus.

BADGER, in old law books, one that was licenfed to buy corn in one place and carry it to another to fell, without incurring the punishment of an engroffer.

BADIA, an ancient town of Bætica on the Anas; now supposed to be Badajos on the Guadiana.

BADIAGA, in the materia medica, the name of a fort of spongy plant, common in the shops in Moscow, and some other northern kingdoms. The use of it is the taking away the livid marks from blows and bruifes, which the powder of this plant is find to do in a night's

BADIANE, or BANDIAN, the feed of a tree which grows in China, and fmells like anifefeed. The Chinefe, and the Dutch in imitation of them, fomctimes use the badiane to give their tea an aromatic talte.

BADIGEON, a mixture of platter and fice-flone, well ground together, and fifted; used by statuaries to fill up the little holes, and repair the defects in Rones, whereof they make their flatues and other work.

The same term is also used by joiners for saw-dust mixed with strong glue, wherewith they fill up the chaps and other defects in word after it is wrought.

BADILE (Antonio), history and portrait painter, was born at Verona in 1480, and by great fludy and application acquired a more extensive knowledge of the man principles of pointing than any, of his predecellen. He was confessedly a most eminent artist; but he derived greater honour from having two fach the place as Eaolo Veronele and Baptista Zelotti, than he hid even from the excellence of his own composiabout He hed in 1500. His colouring was admirably good; his carnations beautiful; and his portraits preferred the perfect relemblance of fieth and real life; nor had he any canfe to envy the acknowledged merit of Titian, Giergione, or the best of his cotemporaries.

BADIS, a fortrels of Livonia, subject to Russia. E. Long. 23. 10. No. Lat. 59, 150, 100 (100)

BADIUS (Conrad); and (Stephen Robert), his brother; French refugees; celebrated as printers at Geneva, and Conrad as an author. The latter died in 1566.

Batylia.

BÆCKEA, in botany: a genus of the oclandria order, belonging to the monogynia class of plants. The calyx is a permanent perianthium, confifting of a fingle funnel-shaped leaf, out into five legments at the brim; the corolla confifts of five roundish spreading petals inforted into the calyx; the pericarpium is a globoic expfule, made up of four valves, and containing four cells, in which are a few roundish angular feeds.

BÆTERRÆ, an ancient town of the Techolages in Gallia Narbonensis; now Besters, on the east bank of the Obris, now Orbis or Orbe, in Lower Languedoc.

BATICA, a province of ancient Spain, fo called from the famed river Batis, afterwards Twiteffus; now Guadalquiver, or the great river. It was bounded on the west by Lusitania; on the south, by the Mediterranean, and Sinus Gaditanus; on the north, by the Cantabric fea, now the bay of Bileay. On the east and north-east, its limits cannot be so well ascertained, as they are very reasonably thought to have seen in a continual state of fluctuation, as each petty mossirch had an opportunity of encroaching upon his neighbour. The province was divided in two by the river Bigtis already mentioned. On the one fide of which, towards the Anas, were fituated the Turdetani, from whence the kingdom was called Turdetania, though more generally known by the name of Baturia. On the other fide were fituated the Baftuli, Baftetani, and Contestani, along the Mediterranean coasts. The Baituli were supposed to be of Phænician extract, and dwelt along the coafts of the Mediterranean, till, driven from thence by the Moors, they fled into the mountumous parts of Gallicia, which they then called from their own name Baflulia. The Baltetani were fented higher up, on the same coasts. The territories of both . thele made part of what has fince become the kingdom of Grenada; in which there is a ridge of very high mountains, called from the above-mentioned people, the Bufletanium mountains. Mention is also made of their capital Buffetana; a place of such strength, that King Ferdinand was fix months befieging it before he could take it from the Moors .- The whole province of Beetica, according to the most probable account, conrained what is now called Andulufia, part of the kingsom of Grenada, and the outward boundaries of Baremadura.

BÆTIS. See BETICA.

BÆTULO, a town of ancient Spain, in the Terraconenfis; now Budelona in Catalonia.

BÆTYLIA, anointed flores, worthipped by the Phomicians, by the Greeks before the time of Chorens, and by other barbarous actions. They were point only of a black colour, and conferenced to form god, as Saturn, Jupiter, the Sun, dec. Some are of opinion that the true original of these roots is to be defined from the pillar of flone which Jacob excledat Bethel, and which was afterwards worthinged by the fews.

Thele baylia were smich the object of the reneration of the ancient heathener. Many of their idels were no other. In reality, no fort of idol was more common in the eaftern countries, than that of oblong itones erected, and hence termed by the Greeks, zums pillars. In some parts of Egypt they were planted on both fide of the highways. In the temple of Heliogabadus, in Syria, there was one pretended to have fallen from heaven. There was also a famous black stone in

Phrygia, faid to have fallen from heaven. The Romans fent for it and the priests belonging to it with much ceremony, Scipio Nafica being at the head of the embaffy.

Bagdad. empire, was founded by the caliph Al Manfur, the fecond of the house of Al Abbas, after an attempt by the Rawandians to affaffinate him, as already mention-

ed. See ARABIA, Nº 184.

The reasons assigned by the Arabian historians for huilding the city of Bagdad are, That the above-mentioned attempt to affaffinate the caliph had disguited him at his Arabian subjects in general, and that the fpot where Bagdad stood was at a confiderable distance from the city of Cufa particularly; the inhabitants of which were remarkable for their treachery and inconstancy, Al Mansur himself having felt several instances of it. Belides, the people of Irak, who had always continued faithful to him, represented, that by building his capital near the confluence of the Euphrates and Tigris, it would be in a great measure secured from the infults and attacks of those who should have an inclination to dispute the caliphate with him; and that by being fituated as it were in the middle of the tract comprehending the diffricts of Bairaba Cufa, Walet, Mawfel, and Swada, at po great distance from those cities, it would be plentifully supplied with provisions by means of the aforefaid rivers.

ncient ty detibed.

Concerning the origin of the name Randad, there are various accounts, which, being equally infectiain and triffing, merit an attention. The first city that are various accounts, which tenns country intertum and trifling, ment no attention. The first city that went by this name was inputed on the first city that went by this name was inputed on the melecular bank of the Tionis; from those of Moslem troops to the opposite hank. It is supposed to the opposite hank. It is supposed to the many prince took post, and fortified also place of attentions as well as the workmen supplementary in the proof as well as the workmen supplementary in the residual of a see metropolic is near the supplementary of the residual of a see metropolic is near the supplementary if their domainous. Hence the part of the supplementary is the residual built on the eastern and the supplementary and supplementary and a furnished the supplementary and applicate was furnished to the supplementary and applicate was furnished to the supplementary and ambalishes that the supplementary and ambalishes that come to also supplementary and ambalishes that come to also supplementary and ambalishes that come to also supplementary with the thinks to also supplementary and ambalishes in the city was entirely round, with the thinks taking in the tity was entirely round, with the exliph's palace in the centre, and having the great molque susexed to it. The saftern past confilled of an interior and enterior town, each of which was furnished by a small. For fome time the building of the city went but flowly on, pwing to a fearcity of materials for building I for which reason the caliph was sometimes inclined to remove the anaterials of Al Madayen the encient metgopolis of the Persian empire. But, upon trial, he found the stones to be of such an immense fize, that the removal of them to Bagdad would be attended with great diffiwealty and expence; besides, he considered that it would be a reflection upon himself to have it said that he could not finish his metropolis without destroying such a pile of building as perhaps could not be paralleled in the whole world; for which reasons he at length gave over his defign, and erected the city of Bagdad most probably out of the ruins of the ancient cities of Seleucia and Ctefiphon, putting an end to his undertaking

in the 149th year of the Hegira, or four years after Bagdade the city was begun.

From the building of the city of Bagdad to the death of Al Manfur nothing very remarkable happened, excepting some irruptions made into the territories of the Greeks, and by the Arabs into some of the caliph's other territories. In the 157th year of the Hegira also, a grievous famine was felt in Mesopotamia, which was quickly after followed by a plague that de-firoyed great numbers. This year likewife, the Christians, who had been all along very severely dealt with by Al Mansur, were treated with the utmost rigour by Musa Ebn Mosash the caliph's governor; every one who was unable to pay the enormous tribute exacted of them being thrown into prison without distinction.

The next year, being the 158th of the Hegira, the Death of Al caliph let out from Bagdad, in order to perform the Manlur. pilgrimage to Mecca: but being taken ill on the road, he expired at Bir Maimun, whence his body was carried to Mecca; where, after 100 graves had been dug, that his sepulchre might be concealed, he was interred, having lived, according to some 63, according to others 68 years, and reigned 22. He is faid to have been extremely covetous, and to have left in his treasury 600,000,000 dirhems, and 24,000,000 dinars. He is reported to have paid his cook by affigning him the heads and legs of the animals dreffed in his kitchen, and to have obliged him to procure at his own expence

all the fuel and vessels he had occasion for.

When Al Mansur expired at Bir Maimun, he had Succeeded only his domestics and Rabi his freedman with him. by Al The latter of these, for some time, kept his death concealed, and pretended to have a conference with him; in which, as he gave out, the caliph commanded him to exact an oath of allegiance to Al Mohdi his fon, as his immediate fuccessor, and to Isa F.bn Musa his coulin-german, as the next apparent heir to the crown. He then despatched a courier to Bagdad with the news of Al Manfur's death; upon which Al Mohdi was unanimoully proclaimed caliph. Ifa Ebu Mufa, however, no fooner heard this news, than he began to entertain thoughts of fetting up for himself at Cufa, where he then refided; and in order to facilitate the Ret Al Mohdi being apprifed of his defection, fent a detachment of 1000 horse to bring him to Bagdad; which being done, Al Mohdi not only prevailed upon him to own his allegiance to him, but also to give up his right to the succession for 10,000 according to some, or according to others for 10,000,000,

dinare.

Aron, the accellion of Al Mohdi to the 164th year Rebellion from the accellion of Al Mohdi to the 164th year Rebellion of Al Mohdi to the 164th year Rebellio of the Hegira, the most remarkable event was the re-of Al Mo-bellian of Al Mokanna. This impious impostor, whose kanna. true name was Haken Ebn Helbom, came originally from Khoralan, and had been an under secretary to Abn Modern governor of that province. He after-wards turned toldier, and palled thence into Mawaralughe, where he gave himself out for a prophet. The name of Al Mokanna, as also that of Al Borkai, that is, the peiled, he took from his cultom of covering his face with a veil or girdle malk, to concel his deformity; he having lost an eye in the wars, and being otherwise of a despicable appearance; though his fellowers pretended he did this for the same reason that

Bagda. Moses did, viz. lest the splendour of his countenance fhould dazzle the eyes of his beholders. In fome places he made a great many profelytes, deluding the people with a number of juggling tricks which they fwallowed as miracles, and particularly by caufing the appearance of a moon to rife out of a well for many nights together; whence he was also called in the Perfian tougue, Sazendeb mak, or the moon-maker. This wretch, not content with being reckoned a prophet, arrogated to himfelf divine honours; pretending that the Deity refided in his person, having proceeded to him from Abu Moslem, in whom he had taken up his relidence before. At last this impostorigated an open rebellion against the caliph, and made himself master of f veral fortified places in Khoralan, fo that Al Mohdi was obliged to fend one of his generals with an amy against him. Upon the approach of the caliph's troops, Al Mokanna retired into one of his Arong fortrelie which he had well provided for a fiege; and fent his emiffaries abroad to perfuade the people that he raifed the dead to life, and foretold future events. Cin aghe Det being closely befreged by the caliph's forces, and of the and from no possibility of escaping, he gave posson in will in the wine to his whole family and all that were with him in the castle; when they were dead, he burnt their bodies, together with all their furniture, provisions, and cattle; and lastly, he threw himself into the slames, er, as others fay, into a tub of aquafortis, or fome other preparation, which confumed every part of him except the hair. When the beliegers therefore entered , the place, they found no living creature in it, except one of Al Mokanna's concubines, who, suspecting his defigu, had hid herfelf, and now discovered the whole matter. This terrible contrivance, however, failed not to produce the defined effect. He had promifed his followers, that his foul should transmigrate into the form of an old man riding on a grayish coloured benft, and that after fo many years he would return and give them the earth for their possession; which ridiculous expectation kept the feet in being for feveral

Harun Alratehid's incole against the virceks.

r.c1s.

All this time war had been carried on with the Greeks, but without any remarkable fuccess on either fide. In the 164th year of the Hegira, however, A. Mohdi ordered his fon Harun Al Raschid to penetrate into the Greek territories with an army of 95,000 mes. Harun, then, having entered the dominions of the emit prefs Irene, defeated one of her commanders that add anneed against him; after which he laid waste feveralof the imperial provinces with fire and swords and even threatened the city of Confiantinople itfelf Car this the emprels was fo terribed, that the preschaled at peace with the caliph by paying him as annual tribute. of 70,000 pieces of gold; which for the present me leaft, delivered her from the depredations of shele barbarians. After the figning of the treaty, Haran returnable dark- cording to some of the oriental historians, the sun one day, a little after his rifing, totally loft his light in a moment, without being eclipfed, when neither any fog nor any cloud of dust appeared to obscure him. This

eightful darkness continued till noon, to the great aishment of the people settled in the countries where

In the 260th year of the Hegira, Al Mohdi was

poisoned, though undefiguedly, by one of his concu- Bagdad. bines named Hofanab. She had deligned to delitroy one of her rivals whom the imagined to have too great an afcendant over the caliph, by giving her a Al Mohdi poisoned pear. This the latter, not suspecting any poisoned; thing, gave to the caliph; who had no fooner eaten it than he felt himfelf in exquisite torture, and soon after expired.

On the death of Al Molidi, he was succeeded by as likewise his eldeft fon Al Hadi; who having formed a defign to his fucceffor deprive his younger brother Harun Al Raschid of his Al Hidi. right of fuccession, and even to allashinate him, was poisoned by his vizier in the 170th year of the Hegica; and on his death the celebrated callph Harun Al Rafchid afcended the throne.

This was one of the best and wifest princes that Hurun Al ever fat on the throne of Bagdad. He was also ex-Rafchid catremely fortunate in all his undertakings, tho' he did liph. not much extend his dominions by conqueit. In his time the Modern empire may be faid to have been in its most flourshing state, though by the independency of the Moderns in Spain, who had formerly fet up a caliph of the house of Ommiyals, his territories were not quite to extensive as those of some of his predecelfors. He postelled the provinces of Syria, Palestine, Extent of Arabia, Perha, Armenia, Natelia, Media or Aderbijan, Extent of Babylonia, Affyria, Sindia, Billia, Media or Aderbijan, his empire. culty.

In the 186th year of the classes, beginning this divides the sty to 8pz, the call on the classes of the consideration of the extensive dominates and the class, the allies of the provider of Syria, Train, the class, the Arabia, lattle the Median of Syria, Train, and the provider of Syria, the characteristic and acceptance of Syria, and the syria, and the syria of Syria, the syria of Syria, and the syria of Syria, the syria of Syria, and the syria of Syria, the syria of Syria, and the syria of Syria, the syria of Syria, and the syria of Syria, the syria of Syria, and the syria of Syria, the syria of Syria, and Egyptiand Ethings to the fireits of Gibreitar, with the dignity of caliple; to Al Mamun the fecond, he affigued Perfin, Kerman, the Indies, Khoralan, Tabreffen, Cableffan, and Zableffan, together with the vast province of Mawaramahr; and to his third fon Al. Kalem, he gave Armenia, Natolia, Jorjan, Georgia, Gircaffia, and all the Moftem territories bordering upon the Euxine fea. As to the order of succession, Al Amin was to ascend the throne immediately after his father's decease; after him, Al Mamun; and then Al Kafem, whom he had fornamed Al Mutaman.

The most considerable exploits performed by this His success caliph were against the Greeks who by their perfidy ful wars provoked him to make war upon them, and whom he with the always overcame. In the 187th year of the Hegira, the caliph received a letter from the Greek emperor

perial dignity, commanding him to return all the money

Bagdad. Nicephorus foon after he had been advanced to the im-

he had extorted from the empress Irene, though that had been fecured to him by the last treaty concluded with that princefs, or expect foon to fee an imperial army in the heart of his territories. This infolent letter fo exasperated Harun, that he immediately assembled his forces and advanced to Heraclea, laying the country through which he passed waste with fire and fword. For some time also he kept that city straitly befieged; which so terrified the Greek emperor, that he fubmitted to pay an annual tribute. Upon this Harun granted him a peace, and returned with his army. But a hard frost foon after happening in these parts, Nicephorus took for granted that Al Raschid would not pay him another vifit, and therefore broke the treaty he had concluded. Of this the caliph receiving advice; he instantly put himself in motion; and, notwithstanding the inclemency of the wenther, forced the emperor to accept of the terms proposed. According to a Perfrom hiltorian, before the holbilities at this time commenced. Nicephorus made the caliph a prefent of feveral fine fwords, giving him thereby plainly to underfland that he was more inclinable to come to blows than to make peace with him. All thele fwords Hathan to make peace with him. All these twords rearron out afunder with his famous tword Samfanah, as if they had been to inany radifies, after which fevere proof there did not appear the least staw in the blade; a clear proof of the woodness of the frength at Harbin's series. This received with the first of the frength at Harbin's series. This received with the first of the last Harbin's principal of East Drakikan, one of the last Harbin's principal of East Drakikan, one of the last Harbin's principal of East Drakikan, one of the last Harbin's principal of East Drakikan, one of the last Harbin's principal of East Harbin's but is faid to have belonged originally to a claim. In a separate went knoong the Musical Drakikan being the manner of the Marada Carlo by which their conditions the manner of the manner of the principal or the word with his house of a certain series of the series of the series of the defined effect: upon the first principal of the series of the first of the last the defined effect: upon the first principal of the series of the seri run cut afunder with his famous fword Samfamah, as if ries, and returned home laden with Looks. The next year Hartin invaded Phrygia; defeated an imperial priny fent to oppose him; and having ravaged the country, returned without any confiderable lois. In the roots year of the Hegira, commencing November 27. 8052 the caliph marched into the Imperial territories with an army of 135,000 men, belides a great number of volunteers and others who were not curolled among his He first took the city of Heracles, from whence he is faid to have carried 16,000 prisoners; after which he made himself master of several other

places; and, in the conclusion of the expedition, he made

a defect on the island of Cyprus, which he plundered

in a terrible manner. This faccels to intimidated Nicephorus, that he immediately fent the tribute due to

Harun, the withholding of which had been the caule

of the war, and concluded a peace upon the caliph's

own terms; one of which was, that the city of Hera- Bagdad clea should never be rebuilt. This perhaps Harun would not have fo readily granted, had not one Rafe 16 Ebn Al Leith revolted against him at Samarcand, and Rebellion affembled a confiderable force to support him in his de-fan.

The next year being the 1918 of the Hegira, the caliph removed the governor of Khorasan from his employment, because he had not been sufficiently attentive to the motions of the rebel Rafe Ebn Al Leith. As this governor had also tyrannized over his subjects in the most cruel manner, his successor no sooner arrived than he fent him in chains to the caliph : but notwithstanding all Harm's care, the rebels made this year a great progress in the conquest of Khoralan.

Next year the caliph found it necessary to march in perion against the rebela, who were daily becoming more formidable. The general rendezvous of his troops was, in the plains of Rakka, from whence he advanced at the head of them to Bagdad. Having at that place supplied the troops with every thing necessary, he contiqued his march to the frontiers of Jorjan, where he was feized with an illness which grew more violent after he had entered that province. Finding himfelf therefore unable to purfue his journey, he religned the command of the army to his fon Al Mamun, retiring himfelf to Tus in Khorafan. We are told by Khondemir, Therealin that, before the caliph departed from Rakka, he had a death ore dream wherein he faw a hand over his head full of red in 1.1 by earth, and at the fame time heard a person pronouncing of causthese words, " See the earth where Hainn is to be buried." Upon this he demanded where he was to be buried; and was inftantly answered, "At Tus." This dream greatly discomposing him, he communicated it to his chief physician, who endeavoured to divert him, selling the caliph that the dream had been occasioned by the thoughts of his expedition against the rebels. He therefore advised him to pursue some savourite divertion that might draw his attention another way. The caliph accordingly, by his physician's advice, prepared a magnificent regale for his courtiers, which lafted feveral days. After this, he put himfelf at the head of his forces, and advanced to the confines of Jorian, where he was attacked by the difference that proved feresto him. As his diforder increased, he found himfelf bbliged to retire to Tus; where being arrived, he fent for his physician, and said to him, " Gabriel, do you remember my dream at Rakka? we are now arrived sate Tus, the place, according to what was prediffied in that dream, of my interment. . Send one of my climitche triffetch me a handful of earth in the neighbourhood of this city." Upon this, Mafrur, one of his favourite enqueha, was despatched to bring a little of the foll of the place to the caliph. He foon returned and brought a handful of red earth, which he prefented to the suph with his arm half bare. At the fight of this, Harun instantly cried out, " In truth this is the earth, and this the very arm, that I faw in my dream. His fpi-I's immediately failing, and his malady being He dies greatly increased by the perturbation of mind enfuing cording t upon this fight, he died three days after, and was hu-the pred

ried in the fame place. According to Abul Faraj, Bastion.

thir Elm Al Leith the arch-rebel's bruther was brought. in chains to the caliph, who was then at the point of death. At the fight of whom Harun declared, the

Bagdad. if he could fpeak only two words, he would say kill bim: and immediately ordered him to be cut to pieces in his prefence. This being done, the caliph foon after expired, in the year of the Hegira 193, having reigned 23 years. The diftemper that put an end to his days is fad to have been the bloody flux.

Upon the arrival of a courser from Tus, with the by his fin news of Al Raschid's death, his son Al Amin was immediately proclaimed caliph; and was no fooner feated on the throne, than he formed a defign of excluding his brother Al Mamun from the fuenction. Accordingly he deprived him of the furniture of the imperial palace of Khorasan; and in open violation of his father's will, who hid bestowed on Al Mamon the perpetual gov r ment of Khorafan, and of all the troops in that prover e, he ordered these forces to murch directly to I' indad. Upon the arrival of this order, Al Mathun expostulated with the general Al Fadl Ebn Rabi who communded his troops, and endeavoured to prevent bis mar ung to Bagdad; but without effects for he punctually obeyed the orders fent by the caliph. Al Mamun, however, took care not to be wanting in fidelity to his brother. He obliged the people of Khorafan to take an oath of fidelity to Al Amin, and reduced fome who had actually excited a confiderable body of the people to revolt, while the general Al Fadl having ingratisted hunfelf with the caliph by his ready complimee with his orders, was cholen prime vivir, and govermed with an absolute fway: Al Amin abandoning himfelf et tirely to diunkennels.

Al I adl was a very able minister; though fearing Al Mamun's refentment if ever he should ascend the throne, he gave Al Amin fuch advice as proved in the end the rum of them both. He told him that his brother had gamed the aftection of the people of Khorasan by the good order and police he had established among them a that his unwearied application to the administration of judice had to attracted their efteen, that the whole province was entirely at his devotion; that his own conduct was by no means relished by his subjects, whose minds were almost totally alienated from him; and therefore that he had but one part to act, which was to deprive Al Mamun of the right of fuccession that had been given him by his father, and transfer it to his own for Mula, though then but an infant. Agreeable to this pernicious advice, the caliph lent for his brother Al Katem from Melopotamia, and recalled Al Mamun from Khorafan, pretending he had occasion for him as an affiltant in his councils.

Al Manun

By this treatment Al Mamun was fo much provoked, that he resolved to came to an open rupture with the a'm a use hiother, in order if possible to Trastrate his wicked dehid been communded, he cut off all communication between his own province and that capital; pretending, that as his father Harun had affigued him the lieutenancy of Khoraian, he was responsible for all the disorders that might happen there during his absence. the also comed money, and would not suffer A. Amin's name to be impressed upon any of the dirhems or dinate firuck in that province. Not content with this, he prevarled upon Rafe Ebn Al Leith, who had been for some time in rebellion, to join him with a body of troops; whole example was foun after followed by gil Inthema Ubu Aafan; which put him in possession

of all the vaft territory of Khorafan. Here he go- Bagdadverned with an absolute sway, officiated in the mosque as Imam, and from the pulpit constantly harangued the people.

The following year, being the 195th year of the Hegua, beginning October 4, 810, the caliph Al Amin, finding that his brother let him at defince, declared war against him, and sent his general Ali Ebn Is with an army of 60,000 men to invade Khorai in. Al Mamun, being informed that Ali was advancing il Amin's against him with fuch a powerful army, put on foot forces deall the troops he could raite, and gave the command to feated Thaher Ebn Hofein, one of the greatest generals of his age. Thater being a man of undrunted resolution, chole only 4000 men whom he led against Al Amin's army. All, feeing to fit all a number of troops advancing against him, was transported with joy, and promiled himself an easy victory. Despiting his enemies, therefore, he behaved in a secure and carcless manner: the transoquence of which was, that his army was entirely defeated, and birafelf killed, his head being afterwards fent as a prefent to Al Mamun, who amply rewarded Thater and Harthema for their fervices.

After this sictory, Al Mamon assumed the title of Caliph, ordered All Amin's name to be omitted in the public prayers, and made all necessary preparations for carrying the war into the were heart of his brother's

carrying the war into the very heart of his brother's dominions. For this purpose he devided his forces into two bodies, and committed devided his forces into two bodies, and committed devided his forces into two bodies, and committed devided his forces into trak by different routes. One of distribution to match into trak by different routes. One of distribution to the defect of the match towards Ahwas, and distribution to before that city.

In the 196th year of the flagger. That is a high all Marie in made a most rapid processing the broaps ander man's rapid his commands. Having absolute the broaps ander man's rapid his commands. Having absolute the latest and the commander of Ahwas, shall be appointed to the constant of the first being the constant of the proposed their pare to him. The product of these conquests, and the infamous standard of Al Amin, excited the people of Egypt. Series, Hejaz, and Taman, inthe people of Egypt, Spris, Hejoz, and Yaman, uningly proclaimed called in all their promoces.

The next year, Al Agenton's forces under Theher Siege of and Harthema, laif hege to Bagdad. As the caliph Bigdad. was then up in that place, and it had a numerous gairifon, the belieged made a vigorous defence, and dedroyed a great number of their enemies. The beliegers, however, incessantly played upon the town with their catapults and other engines, though they were in their turn not a little annoyed by the garrifon with the fame fort of military machines. The latter likewise made continual fallies, and fought like men in despair, though they were always at last beaten back into the town with confiderable lofs. In fliort, the fiege continued during the whole of this year, in which the greatest part of the eastern city, called the Camp of Al Mobdi, was demolished or reduced to allies. The citizens, as

Begdad. well as the garrison, were reduced to the last extremity

by the length and violence of the flege,

In the beginning of the 198th year of the Hegira, Al Amin finding himfelf deferted by his troops, as well as by the principal men of Bagdad, who had kept a private correspondence with Thaher, was obliged to retire to the old town on the well bank of the Tigris. He did not, however, take this flep, before the inhabitants of the new town had formally deposed him, and proclaimed his brother Al Mamuu caliph. Thaher receiving advice of this, caused the old town to be immediately invested, planted his engines against it, and at last flarved it to a surrender. Al Amin being thus reduced to the necessity of putting himself into the hands of one of the generals, choic to implore the protection of Harthema, whom he judged to be of a more humane desposition than Thaber. Having obtained this, he embarked in a small vessel in order to arrive at that part of the camp where Harthema was police; but Thater being informed of his delign, which, if put in execution, he thought would scliple the glory sie had acquired, laid an ambuth for him, which he had not the good fortune to cleape. Upon his arrival in the neighbourhood of Hambema's tent, Thaher's foldiers suffed upon him, drowned all his attendants, and put himself in prilon. Here he was foon after mallacred by Thaher's fervents, who carried his head in triumph to their her's iervents, who carried his head in triumph to their mafter, by article order, it was arterwards exposed to public steet in the things of Bagdad. Thaher afterwards feat it to all Mannessin Khoraian, together with the ring stead of Mannessin Khoraian, together with the ring stead of Mannessin Khoraian, together with the ring stead of the imparial rights. Mat the ingent of these, Al Mannes fell down positions with the major thanks to God for his facts for making the same who brought them a present a million of different in salue about 100,000l. Succeeded Biss large day which the Amini was adiafronted, his by Al Mine the State of the State

Al Mamus. Hegira, maing reigned 20, and ilised 48 or 40 years.
On the death of Al Maman, his brother Al Motafem, by fome of the Oriental hiltorians furnamed Billob, was faluted caliph. He succeeded by virtue of Al Mamun's express nomination of him to the exclusion of his own fon Al Abbas and his other brother Al Kafern, who had been appointed by Harun Al Rashid. In the beginning of his reign he was obliged to employ the whole forces of his empire against one Babec, who had been for a confiderable time in rebellion in Persia and Perhan Irak. This Babee first appeared in the year of the Hegira 201, when he began to take upon him the title of a prophet. What his particular doctrine was, is now unknown; but his religion is faid to

have differed from all others then known in Afia. He Bagdad. gained a great number of profelytes in Aderbijan and the Persian Irak, where he foon grew powerful enough to wage war with the caliph Al Mamun, whose troops he often beat, so that he was now become extremely formidable. The general fent by Al Motafem to reduce him was Haider Ebn Kaus; surnamed Ashin, a Turk by nation, who had been brought a flave to the caliph's court, and having been employed in disciplining the Turkish militia there, had acquired the reputation of a great captain. By him Babec was defeated Babec dewith prodigions flaughter, no fewer than 60,000 men feated. being killed in the fielt engagement. The next year, being the 220th of the Hegira, he received a fill greater overthrow, losing 100,000 men either killed or taken priloners. By this defeat he was obliged to retire into the Gordyman mountains; where he fortified bimfelf in such a manner, that Affhin found it impossible to reduce him till the year of the Hegira 232. This commander having reduced with invincible pasience all Babec's casties one after another, the imposter was obliged to shut himself up in a strong fortrefs called Cafbabad, which was now his last resource. Here he defended himself with great bravery for several months; but at last, finding he should be obliged to furrender, he made his cleape into a neighbouring wood, from whence he foon after came to Affhin, upon that general's promifing him pardon. But Afthin no Paken prifooner had him in his power, than he first caused his soner and hands and feet, and afterwards his head, to be cut off. Put to Babec had supported himself against the power of the caliphe for upwards of twenty years, during which time He defreyhe had cruelly maffacred 250,000 people; it being hised wift outtom to spare neither man, woman, nor child, of the numbers of Mahometans or their allies. Amongst the prisoners Mostenis. taken at Cibaabad there was one Nud, who had been one of Babec's executioners, and who owned that in obedience to his master's commands he had destroyed 20,000 Moslems with his own hands; to which he added, that vast numbers had also been executed by his

account. In the 223d year of the Hegira, the Greek emperor Theophilus invaded the caliph's territories, where he behaved with the greatest cruelty, and by destroying Sozopetra the place of Al Motasem's nativity, notwithdanding his carnell entreaties to the contrary, occasioned the terrible destruction of Amerium mentioned under that article. The rest of this caliph's reign is remark. able for nothing but the execution of Affhin, who was secured of halding correspondence with the caliph's enemies. After his death a great number of idols were fored in his house, which were immediately burned, as silin leveral books faid to contain impious and deteliable opinions.

companions, but that of these he could give no precise

In the 227th year of the Hegira died the caliph Al Death of Motalen, in the 48th or 49th year of his age. He fem. reigned eight years eight months and eight days, was born in the eightmouth of the year, fought eight battles, had 8000 flaves, and had 8,000,000 dinars and 80,000 dirhems in his treasury at his death, whence the Oriental historians give him the name of Al Mothamen, or the Otionary. He is faid to have been to robust, that he once carried a burden of 1000 pounds weight feveral paces. As the people of Bagdad disturbed him with

Bagdad. frequent revolts and commotions, he took the refolution to abandon that city, and build another for his own refidence. The new city he built was first called Samarra, and afterwards Sarra Manray, and flood in the Arabian Irak. He was attached to the opinion of the Motazalites, who maintain the creation of the Koran; and both he and his predecessor cruelly persecuted those who believed it to be eternal.

Al Motafem was succeeded by Al Wathek Bilah, who the following year, being the 228th of the Hegira, and Al Mo- invaded and conquered Sicily. Nothing remarkable tawakkel happened during the reli of his reign the died in the 232d year of the Hegua, and was succeeded by his brother Al Motawakkel.

> The new caliph began his reign with mach of the greated cruelty. The late caliph's vizir having treated Al Motawakkel ill in his brother's lifetime, and opposed his election to the caliphate, was on that mechant now lent to prison. Here the caliph ordered him to he kept awake for feveral days and mights cogether: after this, being fuffered to fall affect, he flest a whole day and night; and after he awoke was thrown into an iron furnace lined with spikes or nails hested red hat, where he was miferably burnt to death. During this reign nothing remarkable happened, except wars with the Greeks, which were carried on with various success. In the year 850 too, being the 245th of the Hegira, violent earthquakes happened in many protimees of the Mollem dominions; and the springs at Mecca failed to fuch a degree, that the celebrated well Zemzem was almost dried up, and the water fold for 100 dishems a bottle.

31 1 offaf-In the 247th year of the Hegira, the caliph was affashinated at the instance of his ion Al Montaser; who fuceceded him, and died in fix months after. He was fucceeded by Al Mostain, who in the year of the Hegira 252 was forced to abdicate the throne by his brother Al Motazz, who afterwards caused him to be privately murdered. He did not long enjoy the dignity of which he had so iniquitously possessed kimielf; being depoted by the Turkith militia (who now began to for up and depose caliphs as they pleased) in the 255th year of the Hegira. After his deposition, he was feat under an efeort from Sarra Manray to Bagdad, where . he died of thirst or lunger, after a reign of four years' That the and about feven mouths. The fate of this caliple seas; of Mo- peculiarly hard: the Turkith troops had mutinied for : 11, a fue their pay; and Al Motazz, not having money to fatisfy, for 50,000 dinars. This the refused, relling this that the had no money at all, although it afterwards appeared that the was pollelled of immenfe trealing a water A his depolition, however, the was obliged to differer; them, and even deposite them in the hands of the new caliph Al Mokhtadi. They confided of 1,000,000 dinars, a bullel of concraids, and mother of pearls, and three pounds and three quarters of tobies of the colour

Al Mokhtadi the new caliph, was the fon of one of Al Wathck's concubines named Korb, or Karb, who is irruption of by fome supposed to have been a Christian. The bethe Zerrings ginning of his reign is remarkable for the irruption of in the Zenjians, a people of Nubis, Ethiopia, and the rtachtadi, ed into the neighbourhood of Baira and Cufa. The

chief of this gang of robbers, who, according to some Ragdad. of the Arab hiltorians, differed but little from wild: beafts, was Ali Ebn Mohammed Ebn Abdalrahmar, who falfely gave himself out to be of the family of Ali Ebn Abu Taleb. This made fuch an impression upon the Shiites in those parts, that they flocked to him in great numbers; which enabled him to feize upon the cities of Baira and Ramla, and even to pais the Tigris at the head of a formidable army. He then took the title of Prince of the Zenjiane, in order to ingratiate himself with those barbarians, of whom his army was principally composed.

In the 256th year of the Hagira, Al Mokhtadi was barbarously murdered by the Turks who had raised him to the throne, and was succeeded by Al Montamed the for of Al Motawakkel. This year the prince of Al Habib's the Zonjana, Ali, or as the is also called Al Habib, success.

made mainthons to the very gates of Bagdad, doing prodigious mississes wherever he passed. The caliph therefore less against him one John with a confiderable transport be was overthrown, however, with very great than the printer by the Zentian, who made himself mafter of 24 of the milith's largest ships in the bay of Basra, put a vall number of challe to the sword, and leized again shortows. reduced.

The following year, being the 263d of the Hegira, beginning September 24. 876, the caliph's forces, under the command of Ahmed Ebn Lebusa, gained two confiderable advantages over Al Habib; but being at last drawn into an ambuscade, they were almost totally destroyed, their general himself making his escape with the utmost difficulty; nor were the caliph's forces able, during the course of the next year, ito make the least impression upon these rebels.

Rebellion ın Egypt pr.Mcd.

thill sicto-

Tious.

In the 265th year of the Hegira, beginning September 3. 878, Ahmed Ebn Tolun rebelled against the which can- caliph, and fet up for himfelf in Egypt. Having afnot be sup-sembled a considerable force, he marched to Antioch, and belieged Sima, the governor of Aleppo and all the provinces known among the Arabs by the name of Al Awasem, in that city. As the besieged found that he was resolved to carry the place by assault, they thought fit, after a short desence, to submit, and to put Sima into his hands. Ahmed no fooner had that officer in Vol. II. Part II.

his power, than he crusted him to be beheaded; after Biglid. which he advanced to Aleppo, the gates of which were immediately opened unto him. Soon after, he relaced Damafous, Hems, Hamath, Kunnifun, and Al Rakka, fituated upon the eaftern bank of the Euphrates. This rebellion to exafperated Al Moramed, that he cauted Ahmed to be publicly curied in all the morques belonging to Bagdad and Irak; and Ahmed on his part ordered the faine malediction to be thundered out against the caliph in all the mosques within his jurisdiction. This year also a detachment of Al Habib's troops penetrated into Irak, and made themselves matters of four of the caliph's ships laden with coin; then they advanced to Al Nomanic, laid the greatest part of it in ashes, and carried off with them several of the inhabitants prisoners. After this they possessed themselves of Jarjaraya, where they found many prisoners more, and destroyed all the adjacent territory with fire and Iword. This year there were four independent powers in the lour in te Moslem dominions, besides the house of Ommiyah in pend nt Spam, viz. The African Moslems, or Aglibites, who low to in had for a long time acted independently; Ahined in "I has Syria and Egypt; Al Leit in Khoratan; and Al Ha-nii Idi bib in Alabia and Irak.

In the 266th year of the Hegira, beginning August 23. 879, Al Habib reduced Rimhormoz, buint the stately mosque there to the ground, put a vast number of the inhabitant, to the fword, and carried away great numbers, as well as a valt quantity of spoil - 46. This was his last successful campaign; for the year sol- Al Hubble lowing, Al Mowaffck, attended by his fon Abul Abbas, having attacked him with a body of 10,000 horse and death. and a few infantry, notwithitanding the vaft dispairty of numbers (Al Habib's army impuniting to 100,000 men), defeated him in feveral battles, recovered moil of the towns he had taken, together with an immense quantity of spoil, and released 5000 women that had been thrown into prison by these barbarians. After these victories, Al Mowassek took post before the city of Al Malnya', built by Al Flabib, and the place of his refidence; burnt all the flips in the harbour; thoroughly pillaged the town; and then entucly definited it. After the reduction of this place, in which he found immenfe treafures, Al Mowaflik purioed the flying Zenjians, put feveral of their chiefs to the fword, and advanced to Al Mokhtara, a city built by Al Habib. As the place was strongly fortified, and Al Habib was posted in its neighbourhood, with an army, according to Abu Jaafer Al Taban, of 300,000 men, Al Mowatfek perceived that the reduction of it would be a mitter of some difficulty. He therefore built a fortres appointe to it, where he erected a mosque, and coined money. The new city, from its founder, was called by the Arabs Al Mowaffelkia, and foon rendered confiderable by the fettlement of feveral wealthy merchants there. The city of Al Mokhtara being reduced to great straits was at last taken by storm, and given up to be plundered by the caliph's troops; after which Al Mowaffek defeated the numerous forces of Al Habib in fuch a manner, that they could no more be rallied

The following year, being the 268th of the Hegira, Al Mowaflek penetrated again into Al Mabiya', and demolished the fortifications which had been raised. line, its former reduction, though the rebels disputed

during that campaign.

5 A

Bagdad. every inch of ground. Next year he again attacked Al Habib with great bravery; and would have entirely defeated him, had he not been wounded in the breaft with an arrow, which obliged him to found a retreat. However, as foon as he was cured of his wound, Al Mowaffek advanced a third time to Al Mabiya', made himself master of that metropolis, threw down the walls that had been raised, put many of the inhabitants to the sword, and carried a vast number of them into captivity.

> The 270th year of the Hegira, commencing July 11. 883, proved fatal to the rebel Al Habib. Al Mowaffek made himself a fourth time master of Al Mabiya's burnt Al Habib's palace, seized upon his family, and fent them to Sarra Manray. As for the asurper himf If, he had the good fortune to escape at this time; but being closely purfued by Al Mowaffek into the province of Ahwaz, where the shattered remains of his forces were entirely defeated, he at last fell into the hands of the victor, who ordered his head to be cut off, and carried through a great part of that region which he hadfo long disturbed. By this complete victory Al Mowes: fek obtained the title of Al Nafir Lidmilbab, that is, the protettor of Mahometanifm. This year also died Ahmed Ebn Tolun, who had feized upon Egypt and Syria, as we have already observed; and was succeeded by his fon Khamarawiyah.

Succels of the fultan et Egypt.

The next year, a bloody engagement happened between the caliph's forces commanded by Al Mowaffek's fon, and those of Khamarawiyah, who had made an irruption into the caliph's territories. The battle was fought between Al Ramla and Damascus. In the beginning, Khamarawiyah found himself so hard pressed, that his men were obliged to give way; upon which, taking for granted that all was loft, he fled with great precipitation, even to the borders of Egypt; but, in the mean time, his troops being ignorant of the flight of their general, returned to the charge, and gained a complete victory. After this, Khamarawiyah, by his just and mild administration, so gained the affections of his subjects, that the caliph found it impossible to gain the least advantage over him. In the 276th year of the Hegira, he overthrew one of the caliph's generals named Abul Saj, at Al Bathnia near the city of Damascus; after which he advanced to Al Rakka on the Euphrates, and made himself master of that place. Having annexed several large provinces to his former dominions, and left fome of his friends in whom he could confide to govern them, he then returned into Egypt, the principal part of his empire, which now extended from the Euphrates to the borders of Nubia and Ethiopia.

Al Mowaffek wes

The following year, being the 278th of the Hegies. was remarkable for the death of Al Mowaffek. He died of the elephantians or leprofy; and while in his last illness, could not help observing, that of 100,000 men whom he commanded, there was not one to miferable as himfelf. This year is also remarkable for the first disturbances raised in the Moslem empire by the Karmatians. The origin of this feet is not certainly known; but the most common opinion is, that a poor fellow, by fome called Karmata, came from Khuzestan to the villages near Cufa, and thene pretended great fanctity and frictuels of life, and that God had enjoined him te pray 40 times a day; pretending also to invite people to the chedience of a certain Imam of the family of

Mahomet; and this way of life he continued till he had Bagdas made a very great party, out of whom he choic twelve as his apostles to govern the rest, and to propagate his, doctrines. He also assumed the title of prince, and obliged every one of his earlier followers to pay him a dinar a-year. But Al Haidam, the governor of that province, finding men neglected their work, and their husbandry in particular, to say those 50 prayers a-day. feized the fellow, and having put him in prison, swore that he should die. This being overheard by a girl belonging to the governor, the, out of compassion, took the key of the dungeon at night from under her master's head, released the man, and restored the key to its place while her master slept. The next morning the governor found his prisoner gone; and the accident being publicly known, raifed great admiration; Karmata's adherents giving out that God had taken him into heaven. After this he appeared in another province, and declared to a great number of people he got about him, that it was not in the power of any person to do him bart; notwithstanding which, his courage failing him, he retived into Syria, and was never heard of any more: After his disappearance, the fect continued and increased; his disciples pretending that their master had manifested himself to be a true prophet, and had left where a new law, wherein he had changed the ceremonies and form of prayer afed by the Moslems, &c. From this year, 276, these factories gave

This caliph proved a warlike and fuccefsful prince Egypt, &c He gained several advantages over the Karmatians, but recovered was not able to reduce them. The Turks, however, by the ca-having invaded the province of Massaralnahr, were liph Mocdefeated with great floughter; after which, Al Modafi carried on a fuccelsful was against the Greeks, from whom he took Seleucis. After this he invaded Syria and Egypt, which provinces he recovered from the boufe of Ahmed Ebn Tolun.

The reduction of Egypt happened in the 202d year Diffrested of the Hegira, after which the war was renewed with fate of she fuccess against the Greeks and Karmatians. The ca-caliphs after liph died in the 295th year of the Hegira, after a reign of about fix years and a half. He was the last of the caliphs who made any figure by their warlike exploits. His successors Al Moktader, Al Kaher, and Al Radi,

Origin of

the 325th

Hegira.

were to diffrested by the Karmatians and numberless usurpers who were every day starting up, that by the 325th year of the Hegira they had nothing lest but New office the city of Bagdad. In the 324th year of the Hegira, of Emir Al Lommencing November 30. 935, the caliph Al Radi, Omra inftl-fixding himfelf distreffed on all fides by usurpers, and tuted by Al having a vizir of no capacity, inflituted a new office superior to that of vizir, which he entitled Emir Al-Omra, or Commandant of commandants. This great

officer was trusted with the management of all military affairs, and had the entire management of the finances in a much more absolute and unlimited manner than any of the caliph's vizirs ever had. Nay, he officiated for the caliph in the great mosque at Bagdad, and had his name mentioned in the public prayers throughout the kingdom. In short, the caliph was so much under the power of this officer, that he could not apply a fingle dinar to his own use without the leave of the E-54 mir Al Omra. In the year 325, the Mostern empire, once fo great and powerful, was shared among the fol-

the Moslem lowing usurpers;

The cities of Walet, Balra, and Cufa, with the reft year of the of the Arabian Irak, were confidered as the property of the Emir Al Omra, though they had been in the beginning of the year feized upon by a rebel called Al Baridi, who could not be driven out of them.

> ... The country of Fars, Parleftan, or Persia properly fo called, was policified by Amado ddawla Ali Ebn Buiya, who select to the circuit Shiraz.

Buiya, who selected to the cry of Shiraz.

Part of that tracking command Al Jebal, together with Persand last, supplied the mountainous part of Persa, and the country of the ancient Parthians, obeyed Bushe desiles the batther of Amado deavie, who reduce a Manhatter part of that country managed and by Walkership the Deplanite.

. Thus the calipha were deprived of all their dominions and reduced to the rank of lovereign pontiffe; in which light, though they continued for some time to be regarded by the neighbouring princes, yet their power never arrived to any height. In this low state the caliphs continued till the year of the Hegira 656, commencing January 8. 1258. This year was rendered remarkable by the taking of Bagdad by Hulaku the the Partars. Mogul or Tartar; who likewife abolished the caliphate,

putting the reigning caliph Al Mostasem Bilan to a Bigdid-most cruel death. These disbolical conquerors, after they had taken the city, massacred, according to cufrom, a vast number of the inhabitants; and after they had plundered it, let it on fire. The spoil they took from thence was prodigiously great, Bagdad being then looked upon as the first city in the world.

Bagdad remained in the hands of the Tartars or History of Mogule to the year of the Hegira 795, of Christ 1392, the city when it was taken by Tamerlane from Sultan Ahmed fince that Ebn Weis; who being incapable of making head a-time. gainst Tamerlane's numerous forces, found himself obliged to fend all his baggage over the Tigris, and abandoned his capital to the conqueror. He was, however, hothy purfued by his enemy's detachments to the plain of Karbella, where feveral skirmishes happened. and a confiderable number of men were lost on both fides. Notwithstanding this disaster, he found means to escape the fury of his pursuers, took refuge in the territories of the Greek emperor, and afterwards repolleffed himfelf of the city of Bagdad. There he remained till the year of the Hegira 803, when the city was taken a fecond time by Tamerlane; who nevertheless restored it to him, and he continued sovereign of the place till driven from thence by Miram Shaw. Still. however, he found means to return; but in the 815th year of the Hegira was finally expelled by Kara Yulef the Turcoman. The descendants of Kara Yusef continued mafters of Bagdad till the year of the Hegira 875, of Christ 1470, when they were driven out by Ufun Cassun. The family of this prince continued till the year of the Hegira 914, of our Lord 1508, when Shalt Ishmael, surnamed Suft or Soft, the first prince of the royal family reigning in Iran or Persia, till the dethroning of the late Shah Hosein, made himself master of it. From that time to this Bagdad has continued to be a bone of contention between the Turks and Perfians. It was taken by Soliman furnamed the magnificent, and retaken by Shah Abbas the great, king of Persia: but being at length besieged by Amouth or Morad IV. with a formidable army, it was finally obliged to furrender to him in the year 1638; fince which time the Persians have never been able to make themselves masters of it for any length of time.

The city is large and populous; and the advantage Its prefina of the Tigris is fo confiderable, with regard to com-state. merce, that although the climate is excessive hot, and in other respects far from being agrecable, yet the number of its inhabitants is computed at 300,000; but before the plague broke out there, they were supposed to be four times that number. It is governed by a ballaw, whole authority extends as far as Courdiffan. The revenues would be immenfe was the government mild's but instead thereof, oppression rules here with the most despotic sway. The bashaw is continually extorting money from the poor inhabitants, and none fuffer more than the unfortunate Jews and Christians, many of whom are put to the most cruel tortures in order to force their property from them. This feries of tyranny and oppression has almost entirely drove them out of the city, in consequence of which the trade must suffer very considerably, they being generally the principal merchants in the place. In the months of June, July, and August, the weather is so. extremely hot, as to oblige the inhabitants to live for.

5 A 2

Bagdad

arched over, to admit the freer circulation of the air. The houses are generally large, built of brick and cement, and are arched over; many of the windows are made of elegant Venetian glass; the ceilings are mostly ornamented with a kind of chequered work, which has generally a noble appearance; most of the houses have a court-yard before them, in the middle of which is a little plantation of orange trees, &c. that has a very pleafing effect. The foil, which would produce not only every conveniency in life, but almost every luxury, is through the natural indolence of the Turks, and the many faults in the government of the country, in a great measure uncultivated and neglected. The revenues are computed at 125 lacks of piastres, or 1,562,50cl. Sterling; but a quarter part of this is not collected, owing to the flothfulness of the Turks, who fuffer the Arabs to plunder them of the remainder. This in fome measure accounts for the cruelties and extortions that are continually practifed here. As the bathaw lives in all the splendour of a sovereign prince, and maintains a very large army, he could not be able to defray his expences, was he not to have recourse to oppression and injustice; and he, by his extensive power, acting almost independent of the porte, only acknowledging it to bring in a balance from thence yearly in his favour.

The bazars or markets here are large and extensive; being covered over with arches built of majoury, and divided into different threets, filled with thops of all kinds of merchandife, to the number of 12,000. Every thing a perfor can have occasion for may be had there. The number of houses in the city is computed at near \$0,000; and each house and shop pay an annual tribute to the bathan, which is calculated to produce the fum of 300,000l. Sterling. Besides these immense revenues that are collected, the bashaw pretends, that by repairs on the fortifications 30,000l. or 40,000l. are annually expended, when not fo many hundreds are taken out of his coffers for that purpole. Likewife clearing the river and mending the bridge become a charge greater than the income, and probably not the value of an English shilling is expended. -To support the expence of the legaglio, their clothes, capacifons of their horfes, and every outward pomp, the amount is confiderable.

On the north fide of the town flands the citadel, which commands the river; and confifts of curtains and bailtions, on which fome very long cannon are mounted, with two mostars in each baltion, placed on no other heds than the ground, and in very bad condition. The carriages of the guns are likewife to unwieldy, and in such a shattered condition, that from their appearance they would not support one firing, but would be shaken in pieces. Their elevatious were from 30 to 40 degrees, but they had no quoins to level them. There are, besides, a number of fmall towers, and loop holes for musketry, placed at certain distances, all well encompassed by a ditch of 25 feet deep, which can be filled at any time by the waters of the Tigris. The citadel is fo close to the houses, that it might be easily taken if possession was once gained of the town; but an attack made towards the land would not probably be successful, as shrices might with the greatest facility be cut into the ditch, and fo

Bagdad. these months in subterraneous apartments, which are overflow the country for miles round; but it is Bagdad. faid an advantageous attack might be made from the water.

> The city, which is fortified by lofty thick walls o brick covered with earth, and strengthened by great towers much refembling cavalier battions, the whole being furrounded by a deep ditch, is in the form of an irregular fquare; but the walls in many places are broken down, occasioned by the disputes which happened on the death of Abdulla Bashaw a few years ago, when two competitors arose in Bagdad for the bathawic, who fought feveral times in the town and citadel, and laid great part of it in ruins. In the interim, the governor of Moulful and Nineveh being arpointed bashaw by the Porte, came hither with a confiderable army, and took possession of the sovereignty, vanquishing his two opponents. Opposite to the city, on the other fide of the river, are very extensive suburbs, from whence shells might be thrown into the town, which would have dreadful effect on a place for closely built. There is a communication between the city and inburbs by a bridge of boats; the only kind of bridge which that river will admit of, as it is broad and deep, and in its ordinary courfe very rapid. At certain scasons it swells to a prodigious height, and overflowing the country occasions many morasics on that fide opposite to the city. Among these are several towns and virlages, whose inhabitants are faid to be the ancient Chaldcans; they are of a particular religion, which they pretend is that of Sieth. The inhabitants of this city are composed chiefly of Persians, Armenians, Turks, Arabs, and Jews, which last act in the capacity of febroffs, or bankers, to the merchants. The Jews, notwithstanding the fevere treatment they meet with from the government, are induced to live here from a reverence to the prophet Erekiel, whole manfolcum they pretend is a day's journey from the city. Besides the Jews who reside here, there are many that come every year out of devotion to visit the prophet's tomb. There are also two European gentlemen, a Venetian and a Frenchman, with five Romith priefts, who are Frenchmen and Italians. Two observer pels are permitted for those of the Romith and Greek perfuations; at the former the five priods officiate. In the city are several large beautiful mosques, but into which Christians are never suffered to enter if known to be such, for fear it should defile them. The Mahometan women are very richly dreffed, wearing bracelets on their arms and jewels in their ears: the Arabian women have the partition between their noffrils bored, wherein they wear rings.

There are also a number of antique buildings. At the diffance of about ten miles fland the ruins of an ancient tower called the Tower of Nimrod. Whether this tower was at first of a square or round form is now difficult to determine: though the former is most probable, because all the remaining bricks are placed fquare, and not in the least circular. The bricks are all twelve inches fquare, and four and a half thick. The cement is of mud or flume, mixed with broken reed, as we mix hair with mortar; which flime might either have been had from one of the great rivers, or taken out of one of the fwamps in the plam, with which the country hereabout very much abounds. The height of the ruin is 126 feet; the diameter of the

nggage. Jargest and middle part about 100 feet. It would appear to be folid to the centre; yet near the top there is a regular opening of an oval form. The circumfeence of that part of the tower which remains, and is a ove the rubbish, is about 300 feet; but probably co ild the foundation be come at, it would be found of far'greater extent. The present Turks, Jews, and Arabians, are fond of believing this to be the identical ruin of the ancient tower of Babel, for which they affign a variety of reasons; but all so void of the appearance of truth, that to fet about confuting them would be losing time in trifles. It appears to have been a beacon or watch-tower, to give notice of the approach of an enemy; or perhaps was used as an observatory to inspect the various motions of the heavenly bodies; which science was so much cultivated among the ancient inhabitants of this country, that even the Grecians, though delirous of being effeemed the inventors of all arts and fciences, could never deny the Babylonians the honour of having laid the foundations of

> BAGGAGE, in military affairs, denotes the clothes. tents, utenfils of divers forts, provisions, and other ne-

ceffaries belonging to the army.

Before a march, the waggons with the baggage are marshalled according to the rank which the several regiments bear in the army; being sometimes ordered to follow the respective columns of the army, sometimes to follow the artillery, and fornetimes to form a column by themselves. The general's baggage marches first; and each waggon has a flag, showing the regiment to which it belongs.

Packing up the Barranie, vafa colligere, was a term amon, the Romans, for preparing to go to war, or to

be ready for an expedition.

The Romans diftinguished two forts of baggage; a greater and left. The lefter was carried by the foldier on his back, and called farring; confifting of the things most necessary to life, and which he could not do without. Hence colligere farcinas, packing up the baggage, is used for decemping, caftra movere. The greater and heavier was carried on horses and vehicles, and called oneral Mence mera vehiculorum, farcine hominum. The baggage horses were denominated fagmentarii equite whom with the fact of

The Roman foldiers in their marches were heavy loaden; infomuch, that they were called by way of jest muli mariani, and arumna. They had four forts of luggage, which they never went without, viz. corn or buccellatum, utenfils, valli, and arms. Cicero observes, that they used to carry with them above half a month's provisions; and we have inflances in Livy, where they carried provisions for a whole month. Their utenfils comprehended those proper for gathering fuel, dreffing their meat, and even for fortification or intrenchment; and what is more, a chain for binding captives. For arms, the foot carried a fpear, shield, faw, basket, rutrum, hatchet, lorum, falx, &c. Also stakes or pales, valli, for the fudden fortifying a camp; fometimes feven or even twelve of these pales were carried by each man, though generally, as Polybius tells us, only three or four. On the Trajan column we fee foldiers reprefented with this fardel of corn, utenfils, pales, &c. gathered into a bundle and laid on their floulders. Thus inured to labour, they grew strong, and able to undergo any fatigue in battle; the greatest heat of which Biglana never tired them, or put them out of breath. In aftertimes, when discipline grew stack, this luggage was thrown on carriages and porters shoulders.

The Macedonians were not less inured to hardship than the Romans: when Philip first formed an army, he forbade all use of carriages; yet, with all their load,

they would march, in a fummer's day, 20 miles in military rank.

BAGLANA, or BugLANA, a province of the kingdom of Dekkan in the Mogul's empire. It 19 bounded on the north and east by Guzerat and Ballagat; and on the fouth and west by that part of Viziapur called Konban, belonging to the Mahrattas. It ends in a point at the fea coast between Daman and Balfora, and is the least province in the kingdom. The Portuguele territories begin in this province at the port Daman, 21 leagues fouth of Surat; and run along the coast by Bassaim, Bombay, and Chawl, to Dabul, al-

most 50 leagues to the north of Goa.

BAGLIVI (George), a most illustrious physician of Italy, was a native of Apulia, and born about the year 1688. He studied at Padua, where he became doctor; and then went to Rome, where he was chosen prefessor of anatomy. He was a man of most uncommon force of understanding, of which he gave ample proofs in many curious and accurate productions, philofophical as well as medicinal. He died at Rome 1706. in the flower of his age, and when he was no mo e than 38. A collection of his works were printed first in 1710, quarto; and have fince been reprinted, in the fame fize, at various places. His Praxis Medica, and De Fibra Matricis, are the principal pieces. He wrote a Differtation upon the Anatomy, Bite, and Effects, of the Tarantula, which is the production of his country; and gave a particular account of the earthquake at Rome and the adjacent cities in 1703. His works are all in Latin.

BAGNAGAR, a town of Afia, in the dominions of the Great Mogul, and capital of the kingdom of Golconda in the peninfula on this fide the Ganges. The inhabitants within the town are the better fort; the merchants and meaner people inhabiting the fuburbs, which is three miles long. It is chiefly remarkable for a magnificent refervoir of water, fur-rounded with a colonnade supported by arches. It is feated on the river Newa, in E. Long. 96. o. N. Lat.

BAGNARA, a sea pert town of Italy in the kingdom of Naples, in the farther Calabria, with the title of a duchy. E. Long. 16. 8. N. Lat. 38. 15.

BAGNAREA, a town of Italy in St Peter's patrimony, and in the territory of Orvieta, with a bishop's

fee. E. Long. 12. 10. N. Lat. 42. 36.

BAGNERES, a town of France in Gascony, and in the county of Bigorre, so called from its mineral waters. It is feated on the river Adour, in E. Long. c. 12. N. Lat. 43. 3

BAGNIALACK, a large town of Turkey in Europe, in the province of Bosnia. E. Long. 18. 10.

N. Lat. 44. 0.

BAGNIO, an Italian word, fignifying a bath. We use it for a house with conveniencies for bathing, cupping, fweating, and otherwise cleaning the body; and tometimes for worfe purpofes. In Turkey it is beBagpipe.

Bagnolas come a general name for the prifons where the flaves are enclosed, it being usual in these prisons to have baths.

BAGNOLAS, a town of Lower Languedoc in France. It has a very handsome square, and two fountains which rife in the middle of the town; the waters of which, being received in a bason, are conveyed by a canal out of town, and from thence to the lands about it. E. Long. 4. 43. N. Lat. 44. 10.

BAGNOLIANS, or BAGNOLANAES, in churchhistory, a fect of heretics, who in reality were Manichees, though they fomewhat disgnifed their errors. They rejected the Old Testament and part of the New; held the world to be eternal; and affirmed that God did not create the foul when he infufed it into the body.

BAGOI, among the ancient Persians, were the fame with those called by the Latins spadones, win. a species of cumehs, in whom the canal of the penis was fo contoried by a tight vinculum, that they could not enut the femen.

· BAGPIPE, a mulical inflrument, of the wind kind, chiefly used to Scotland and Ireland. The pecularity of the begpipe, and from which it takes its name, is, that the air which blows it is collected into a leathern bag, from whence it is pressed out by the arm into the pipes. These pipes consist of a bass, and tenor or rather treble; and are different according to the species of the pipe. The bass part is called the drone, and the tenor or treble part the chanter. In all the species, the bass never varies from its uniform note, and therefore very defervedly gets the name of drone; and the compals of the chanter is likewife very limited. There is a confiderable difference between the Highland and Lowland bagpipe of Scotland; the former being blown with the mouth, and the latter with a fmall bellows: though this difference is not efiential, every species of bagpipe being capable, by a proper confiruction of the reeds, of producing music, either with the mouth or bellows. The following are the species of bagpipes most commonly known in this

1. The Irifle Pipe. This is the loftest, and in some respects the most melodious of any, so that music books have been published with directions how to play on it. The chanter, like that of all the rest, has eight holes like the English stute, and is played on by opening and shutting the holes as occasion requires; the bals confifts of two flort drones and a long one. The lowest note of the chanter is D on the German flute. being the open note of the counter string of a wiolin; the small drone (one of them commonly being stopped up) is tuned in unifon with the note above. this, and the large one to an octave below: fo that a great length is required in order to produce such a low note, on which account the drone hath fometimes there turns. The inftrument is tuned by least tening or shortening the drone till it founds the note defired

2. The Highland Bag Pipe. This confifts of a chanter and two fhort drones, which found in unifon the 1 est note of the chanter except one. This is exceedingly loud, and almost deafening if played in a room; and is therefore mostly used in the fields, for trequires a prodigious blaft to found To that those unaccustomed to it cannot imagine how Highland pipers can continue to play for hours Bagpipe together, as they are often known to do. For the fame reason, those who use the instrument are obliged either to fland on their feet or walk when they play This instrument hath but nine notes; its scale, however, hath not yet been reduced to a regular standard by coshparing it with that of other instruments, so that we can fay nothing about its compals. Those who are best acquainted with it, however, affirm that it plays only the natural notes, without being capable of variation by flats or sharps.

3. The Scots Lorwland Pipe. This is likewife a very loud instrument, though less so than the former. It is blown with bellows, and hath a bafs like the Irish pipe. This species is different from all the rest, as it cannot play the natural notes, but hath F and C tharp. The lowest note of a good bagpipe of this kind is unifon with C sharp on the tenor of a violin tuned concert pitch; and as it hath but nine notes, the highest is D in alt. From this peculiar construction, the Highland and Lowland bagpipes play two species of music effectially different from one another, as each of them also from every other species of music in the world. Hence these two species of bagpipes deserve notice as curiofities; for the music which they play is accompanied with such peculiar prnaments, or what are intended as fuch, as weither sielin, nor even organ, can imitate, but in a very imperfect manner.

This kind of bagpipe was formerly very much used in Scotland at weddings and other festivals; being indeed extremely well saleulated for playing that peculiar species of Scott motion collect reds. It has been often a matter of furprise for this was pollisle, as the inflrument has only a committee of minerar ten motes at the utmost, and which cannot be waried at in other instruments. In this respect, however, it has a very great compals, and will play an inconceivable variety of tunes. As its notes are naturally to high, there is fcarce any one tune but what is not maily treaspoint by it, so that what would be a flat note on the key incoper for the violin, may be a sharp one an the trapping and though the latter cannot play any flat note. It may nevertheless in this manner play twees which on other instruments would be flat, to as great perfection as these instruments themselves believed as a second

4. The Small Pipe. This is remarkable for its fmallnels, the chanter not exceeding eight inches in length : for which reason, the holes are so near each other, that it is with difficulty they can be closed. This hath only eight notes, the lower end of the chanter being commonly stopped. The reason of this is, to prevent the flurring of all the notes, which is unavoidable in the other species; so that in the hands of a bad player they become the most shocking and unintelligible instruments imaginable: but this, by having the lower hole closed, and also by the peculiar way in which the notes are expressed, plays all its tunes in the way called by the Ita-luns success, and cannot flur at all. It hath no species of music peculiar to itself; and can play nothing which cannot be much better done upon other inflruments; though it is furprifing what volubility some performers on this inflrument will display, and how much they will overcome the natural disadvantages of it. Some of this species, instead of having drones like the others, have their bass parts consisting of a winding cavity in a kind

p. 30.

Melvini

opogr.

cotias.

Barpipe. of short case, and are tuned by opening these to a certain degree by means of fliding covers; from which contrivance they are called shuttle-pipes .- Besides these, t ere are a variety of others, called Italian, German, O. ran, &c. hagpipes, which have nothing different in the " construction from those above described, nor any good quality to recommend them.

> As to the origin of bagpipe music, some are of opinion that it is to be derived from the Danes: but Mr Pennant thinks differently, and gives the following rea-

fons for deriving it from Italy.

" Neither of these instruments (the Highland and Voyage to the Lowland bagpipes above described) were the invention of the Danes or, as is commonly supposed, of any of the northern nations; for their ancient writers prove them to have been animated by the clangor tubarum. Notwithstanding they have had their sæck pipe long among them, as their old fongs prove, yet we cannot allow them the honour of inventing this melodious infirument; but must affert, that they borrowed it from the invaded Caledonians. We must fill go farther, and deprive even that ancient race of the credit; and derive its origin from the mild climate of Italy, perhaps from Greece.

"There is now in Rome a most beautiful bas relievo, a Grecian sculpture of the highest antiquity, of a bagpiper playing on his instrument, exactly like a modern Highlander. The Greeks had their Armons, or infirument, composed of a pipe and blown-up skin: the Romans in all probability borrowed it from them, and introduced it among show frains, who still use it under

the names of pipe and cornu-mufa.

"That maker of mulic, Nero, used one; and had not the empire been to fuddenly deprived of that great artiff, he would fas be graciously declared his intention? have treated the people with a concert, and, among other curious infiruments, would have introduced the uncicularities on highings. Nero perished; but the figure of the arthument is preferved on one of his coins, but highly improved by that great maker: it has the bag and two of the sulgar pipes; but was blown with a believe like an atgan, and had on one fide a row of nine unequal pipes, refembling the fyriax of the god The bagpipe, in the unimproved state, is also represented in an ancient sculpture; and appears to have lind two long pipes or drones, and a fingle fort pipe for the fingers. Tradition fays, that the kind played on by the mouth was introduced by the Danes; as: theirs was wind music, we will admit that they might have made improvement, but more we cannot allow : they were skilled in the use of the trumpet; the Highlanders in the piohb, or bagpipe.

Non tuba in usu illis, conjetta at tibia in utrum Dat belli fignum, et martem vocat horrida in arma*."

The bagpipe appears to have been an instrument of great antiquity in Ireland, though it is uncertain whence they derived it. Mr Pennant, by means of an antique found at Richborough in Kent, has determined that the bagpipe was introduced at a very early period into Britain; whence it is probable that both Irish and Danes might borrow the instrument from the Caledonians, with whom they had fuch frequent inter-Aristides Quintilianus informs us, that it prevailed in the Highlands in very early ages; and in-

deed the genius of the people seems to render the opi- Bagpire nion highly probable. The attachment of that people to their mulic called pibrachs is almost incredible, and Bahama, on some occasions is said to have produced effects little less marvellous than those ascribed to the ancient mufic. At the battle of Quebec in 1760, while the British troops were retreating in great disorder, the general complained to a field officer in Fraser's regiment of the bad behaviour of his corps. "Sir (faid he with fome warmth), you did very wrong in forbidding the pipers to play this morning: nothing encourages the Highlanders to much in the day of action. Nay, even now they would be of use."-" Let them blow like the devil, then (replies the general), if it will bring back the men." The pipers were then ordered to play a favourite martial air; and the Highlanders, the moment they heard the music, returned and formed with alacrity in the rear. In the late war in India, Sir Lyrc Coote, aware of the attachment of the Highlanders to their favourite instrument, gave them 50l. to buy a pair of bagpipes after the battle of Porto Nuovo.

Formerly there was a kind of college in the island of Sky where the Highland bagpipe was taught; the teachers making use of pins fluck into the ground instead of musical notes. This college, however, has been for some time entirely dissolved, and the use of the Highland pipe become much less general than before. At last a society of gentlemen, thinking it perhaps impolitic to allow the ancient martial mufic of the country to decline, refolved to revive it by giving an annual prize to the best performers on the instrument. These competitions were first held at Falkirk, but for a good number of years at Edinburgh; where the only furviving member of the ancient college of Sky is now

professor of bagpipe music.
The Lowland pipe, as has been already observed, is an inftrument effentially different from the Highland pipe; it was reformed and the music improved by George Mackie, who is faid to have attended the college of Sky feven years. He had before been the best performer on that instrument in that part of the country where he lived: but, while attending the college at Sky, he adapted the graces of the Highland music to the Lowland pipe. Upon his return, he was heard with aftonishment and admiration; but unluckily, not being able to commit his improvements to writing, and indeed the nature of the instrument scarce admitting of it, the knowledge of this kind of music hath continued to decay ever fince, and will probably foon wear out all together. What contributes much to this is, that bagpiners, not content with the natural nine notes which their instrument can play easily, force it to play tunes requiring higher notes, which disorders the whole instrument in such a manner as to produce the most horrid discords; and this practice brings, though undefervedly, the inflrument itself into contempt.

BAGUETTE, in architecture, a small round moulding, less than an astragal, and so called from the resem-

blance it bears to a ring.

BAHAMA, or Lucaya, Islands, are the eaftermost of the Antilles, lying in the Atlantic ocean. They are fituated to the fouth of Carolina, between 22 and 27 degrees N. Lat. and 73 and 81 degrees W. Long. They extend along the coast of Florida quite down to

Bahl

Bahama the isle of Cuba, and are faid to be 500 in number, fome of them only more rocks; but twelve of them Baharen. are large, fertile, and in nothing different from the foil of Carolina: all are, however, uninhabited except Providence, which is 200 miles east of the Floridas; though some others are larger and more fertile, on which the English have plantations. Between them and the continent of Florida is the gulf of Bahama, or Florida, through which the Spanish galeons fail in their passage to Europe.

These islands were the first fruits of Columbus's discoveries; but they were not known to the English till 1667, when Captain Seyle, being driven among them in his passage to Carolina, gave his name to one of them; and being a fecond time driven upon it, gave it the name of Providence. The English, observing the advintageous fituation of thefe islands for being a check on the French and Spaniards, attempted to fettle them in the reign of Charles II. Some unlucky accidents prevented this fettlement from being of any advantage; and the ifle of Providence became a harhour for the bucamers or pirates, who for a long time infeffed the American navigation. This obliged the government in 1718 to fend out Captain Woodes Rogers with a fleet to diffodge the pirates, and for making a fettlement. This the captain effected; a fort was erected, and an independent company was thationed in the illand. Ever fince this last fettlement thefe if inds have been improving, though they advance but flowly. In time of war, people gain confiderably by the prizes condemned there; and at all times by the wrecks, which are frequent in this labyrinth of rocks and thelves. The Spaniards and Americans captured thefe illands during the last war; but they were retaken by a detachment from St Augustine, April 7. 1783.

BAHAR, or BARRE, in commerce, a weight used

in feveral places in the East Indies.

There are two of their weights; one the great bahar, with which they weigh pepper, cloves, nutmegs, ginger, &c. and contains 550 pounds of Portugal, or about 524lb. 93. avoirdupors weight. - With the little bahar, they weigh quickfilver, vermilion, ivory, filk, &c. It contains about 437lb. 93. avoirdupois weight.

BAHAREN, an island in the Persian gulf, situated in E. Long. 50. o. N. Lat. 26. o. This island is chiefly remarkable for its pearl fiftery, and has often changed its masters. It fell with Ormus under the dominion of the Portuguese, was again restored to Persia by Thamas Khouli Kan; and after his death the confusion into which his empire was thrown, gave an opportunity to an enterprising and ambitious Arab of taking possession of the island, where he still maintains his authority. Baharen was famous for its pearl fishery even at the time when pearls were found at Ormus, Karek, Kashy, and other places in the Perfian gulf; but it is now become of much greater confequence; all the other banks having been exhaufted, while this has suffered no sensible diminution. The sime of fishing begins in April, and ends in October. It is confined to a tract four or five leagues in breadth. The pearls taken at Baharen, though not so white as those of the or Japan, are much larger than those of the blace, and more regularly shaped than

those of the latter. They have a yellowish colour; but have also this good quality, that they preserve their golden hue, whereas the whiter kind lofe much of their luffre by keeping, especially in hot countries. Th annual revenue from the Baharen pearl fiftery is cor puted at about 187,500l. The greatest part of ne pearls that are uneven are carried to Constantine ple and other ports of Turkey, where the larger go to compole ornaments for head dreffes, and the smaller are used in embroideries. The perfect pearls must be referved for Surat, whence they are diffributed through all Indoftan.

BAHI, a province of Luconia or Manilia, one of the Philippine islands in the East Indies, belonging to the Spaniards. It is remarkable for producing excellent betel, which the inhabitants, Spaniards as well as natives, perpetually chew from morning till night. It is also the place where most of the ships are built. But the natives fuffer much from this work; feveral hundreds of them being constantly employed in it, on the mountains, or at the port of Cavite. The king allows these labourers a piece-of-eight per month, with a fufficient quantity of rice. The whole province contains about 6000 tributary natives.

BAHIA, DE TODOS LOS SANCTOS, A province of Brasil in South America, belonging to the Portuguese, and the richest in the whole country; but unhappily the air and climate do not correspond with other natural advantages: yet to fertile is the province in fugar and other commercial articles, that the Portuguele flock hither not only as it is the feat of affluence, but also of pleasure and grandeur. The capital, called St Salvador, or Cividad de Babia, is postulous, magnificent, and beyond comparison the most gay and opulent city in Brafil. It Hands on a bay in Sa Lat. 12. 11. is firong by nature, well fortified, and always defended by a numerous garrison, The contains 12,000 or 14,000 Portuguele, and about three times as many negroes, besides people of different nations who choose to relide in that city.

BAHIR, a Hebrew term fignifying famous or illustrious; but particularly used for a book of the Jews, treating of the profound mysteries of the cabbala, being the most ancient of the Rabbinical works.

BAHUS, a strong town of Sweden, and capital of a government of the fame name, feated on a rock in a small island, in E. Long. 11. 10. N. Lat. 57. 52.

BAJA, BAYJAH, or BEGIA, a town of the kingdom of Tunis in Africa, supposed to be the ancient Vacca of Salluft, and Oppidum Paggense of Pliny. It was formerly, and still continues to be, a place of great trade, and the chief market of the kingdom for corn; of which the adjacent territories produce fuch abundance, that they can supply more than the whole kingdom with it; and the Tunifians fay, that if there was in the kingdom fuch another town as this for plenty of corn, it would become as cheap as fand. Here is also a great annual fair, to which the most distant Arabian tribes refort with their families and flocks. Notwithstanding all this, however, the inhabitants are very poor, and great part of the land about the town remains uncultivated, through the cruel exactions of the government, and the frequent incursions of the Arabs, who are very powerful in these parts. The town stands on the declivity of a hill on the road to Constantina, about 10

leagues

leagues from the northern coast, and 36 south-west from Tunis: and hath the convenience of being well watered. On the highest part is a citadel that commands the chole place, but is now of no great strength. The walls were railed out of the runs of the ancient Vacca, any have fome ancient infcriptions.

BAJA, a populous town of Hungary, feated on the

Danube, in E. Long. 19. 50. N. Lat. 46. 40.

BAIÆ, an ancient village of Campania in Italy, between the promontory of Milenum and Putcoli, on the Sinus Baianus; famous for its natural hot baths, which served the wealthier Romans for the purposes both of medicine and pleafure.-The variety of those baths, the foftuels of its climate, and the beauty of its landscape, captivated the minds of opnient nobles, whose passion for bathing knew no bounds. Abundance of linen, and difuse of ointments, render the practice less necessary in modern life; but the ancients performed no exercise, engaged in no fludy, without previous ablutions, which at Rome required an enormous expence in aqueducts, floves, and attendants: a place therefore, where waters naturally heated to every degree of warmth bubbled spontaneously out of the ground, in the pleafantest of all fituations, was fuch a treasure as could not be overlooked of Baine was this place in the highest perfections its entry communication with Rome was also a point of great weight. Hither at first retired for a temporary relaxation the mighty rulers of the world, to their such their nerves and rewive their livings, fatigued with bloody campaigns and
civil contents. Their imbitations were incall and modelt:
but loop intreasing limits added palace to palace with
fuch crossing interpretation, that ground was
wanting to the living models, carried their foundations
into the living world, carried their foundations
into the living living living that clement back from its

function of the living living any longer an active
function the palitical charges a phoever, from an indolive of the palitical charges a phoever, from an indolive of the palitical charges a phoever, from an indolive of the palitical charges a phoever, from an indolive of the palitical charges a phoever, from an indolive of the palitical charges a phoever, from an indolive of the palitical charges a phoever the pleasures of
a rown were combined with the livects of a rural life; rulers of the world, to firing anon their nerves and rea town were combined with the fweets of a rural life; who wir willied to withdraw from the dangerous neighbourhood of a court, and the baneful eye of informers, flocked hither to enjoy life untainted with fear and trouble. Such affluence of wealthy inhabitants tendered Baix as much a miracle of art as it was before of nature; its fplendour may be inferred from its innumerable ruins, heaps of marbles, molaics, flucco, and other precious fragments of talte .- It flourished in full glory down to the days of Theodoric the Goth; but the destruction of these enchanted palaces followed quickly upon the irruption of the northern conquerors, who overturned the Roman fystem, facked and burnt all before them, and destroyed or dispersed the whole race of nobility. Loss of fortune left the Romans neither the means, nor indeed the thought, of supporting fuch expensive establishments, which can only be enjoyed in perfection during peace and prosperity. No fooner had opulence withdrawn her hand, than the unbridled fea rushed back upon its old domain; moles and buttreffes were torn afunder and washed away; whole promontories, with the proud towers that once Vol. II. Part II.

crowned their brows, were undermined and tumbled Bajader headlong into the deep, where, many feet below the furface, pavements of streets, foundations of houses, and maffes of walls, may still be descried. Internal commotions of the earth contributed also largely to this general devastation; mephitic vapours and stagnated waters have converted this favourite feat of health into the den of pestilence, at least during the estival heats: yet Baise in its ruined state, and stripped of all its ornaments, ftill prefents many beautiful and striking subjects for the pencil. E. Long. 14. 45. N. Lat. 41. 6.

BAJADOR, a cape on the west coast of Africa, fouth of the Canary islands. W. Long. 15. 20. N.

Lat. 27. 0. ...

BAIANUS SINUS, a bay fo called from Baia, (Suctonius); Portus Baiorum, (Pliny); which was enlarged by Augustus, by giving entrance to the sea into the Lacus Lucrinus, and Averni, ordering it to be colled Portus Julius apud Baias, (Suctonius). We also read Baianus Lasus in Tacitus, which some interpret the Lucrima. The modern name is Golfo di Pozquole. From the highest point that forms the bay, a large caffle commands the road, where foreign ships of war usually ride at anchor, the harbour of Naples not being spacious enough for the reception of a fleet: here they enjoy good shelter, watering, and victualling; but in summer risk the health of their crews, on account of the unwholesomeness of the air.

BAJAZET I. fultan of the Turks, a renowned warrior but a tyrant, was conquered by Tamorlane, and exposed by him in an iron cage; the fate he had deflined (it is faid) for his adverfacy if he had been

the victor.

The iron cage, however, so long and so often repeated as a moral leffon, has been rejected as a fable by modern writers, who fmile at the vulgar credulity. They appeal to the Perfian history of Sherefeddin Ali, of which a French version has been given, and from which Mr Gibbon has collected the following more specious parrative of this memorable transaction. "No fooner was Timour informed that the captive Ottoman was at the door of his tent, than he graciously stepped forwards to receive him, feated him by his fide, and mingled with just reproaches a foothing pity for his rank and misfortune. 'Alas!' faid the emperor, the decree of fate is now accomplished by your own fault: it is the web which you have woven, the thorns of the tree which yourfelf have planted. I wished to fpare, and even to affift, the champion of the Moilems: you braved our threats, you defpised our friend. thip; you forced us to enter your kingdom with our invincible armies. Behold the event. Had you vanquithed, I am not ignorant of the fate which you referred for myfelf and my troops. But I disdain to retaliste: your life and honour are secure; and I shall express my gratitude to God by my elemency to man. The royal captive showed some signs of repentance, accepted the humiliation of a robe of honour, and embraced with tears his fon Moula, who, at his request, was fought and found among the captives of the field. The Ottoman princes were lodged in a splendid pavilion; and the respect of the guards could be surpassed only by their vigilance. On the arrival of the haram from Bourfa, Timour restored the queen Despina and her daughter to their father and hufband; but he pi-

Baik al,

Balkal. oufly required, that the Servian princess, who had hitherto been indulged in the profession of Christianity, should embrace without delay the religion of the prophet. In the feast of victory, to which Bajazet was invited, the Mogul emperor placed a crown on his head and a fceptre in his hand, with a folemn affurance of refloring him with an increase of glory to the throne of his ancestors. But the effect of this promife was disappointed by the fultan's untimely death: amidst the care of the most skilful physicians, he expired of an apoplexy at Akshehr, the Antioch of Pilidia, about sine months after his defeat. The victor dropped a tear over his grave; his body, with royal pomp, was conveyed to the monfoleum which he had erected at Bourfa; and his fon Moufa, after recciving a rich prefent of gold and jewels, of horles and arms, was inveiled by a patent in red ink with the kingdom of Anatolia.

Such is the portrait of a generous conqueror, which has been extracted from his own memorials, and dedicated to his fon and grandfon, 19 years after his decease; and, at a time when the truth was remembered by thoulands, a manifelt fallehood would have implied a fatire on his real conduct. On the other hand, of the harsh and ignominious treatment of Bajazet there is also a variety of evidence. The Turkish anmals in particular, which have been confulted or tranferibed by Leunclavius, Pocock, and Cantemir, unanimously deplore the captivity of the iron cage; and fome credit may be allowed to national historians, who cannot fligmatize the Tartar without uncovering the thame of their king and country."-From thefe oppolite premites, Mr Gibbon thinks a fair and moderate conclusion may be deduced. He is fatisfied that Sherefeddin Ali has faithfully described the first oftentations interview, in which the conqueror, whose spizits were harmonized by fuccess, affected the character of generofity. But his mind was infenfibly alienated by the unfeafonable airogance of Bajazet; the complaints of his enemies, the Anatolian princes, were just and vehement; and Timour betrayed a defign of leading his royal captive in triumph to Samarcand. An attempt to facilitate his escape by digging a mine under the tent, provoked the Mogul emperor to impose a harfher referaint; and in his perpetual marches, an iron eige on a waggon might be invented, not as a wanton infult, but as a rigorous precaution. Timour had read in some fabulous history a similar treatment of one of his predecessors, a king of Persia; and Bajazet was condemned to represent the person and explate the guilt of the Roman Cæfar. But the ftrength of his mind and body fainted under the trial, and his premature death might without injuffice be afcribed to the feverity of Timour. He warred not, however, with the dead; a tear and a sepulchre were all that he could beflow on a captive who was delivered from his power; and if Mousa, the son of Bajazet, was permitted to reign over the ruins of Bourla, the greatest part of the province of Anatolia had been reflored by the con-

queror to their lawful fovereign.

BAFRAL, a great lake in Siberia, lying between 52 and 55 degrees of north latitude. It is reckoned to be 500 wersts in length: but only 20 or 30 broad, and in some places not above 15. It is environed on all fides by high mountains. In one part of it, which

, į

lies near the river Dargusin, it throws up an inflammable fulphurcous liquid called Maltha, which the people of the adjacent country burn in their lamps. There are likewife feveral fulphureous fprings near this lake. Its water at a dutance appears of a leggreen colour: it is fresh; and so clear, that qujects may be seen in it several fathoms deep. It does not begin to freeze till near the latter end of December, and thaws again about the beginning of May: from which time till September, a flip is feldom known to be wrecked on it; but by the high winds which then blow, many thipwreeks happen. This lake is called by the neighbouring people Stellatole More, or the Holy Lake; and they imagine, that when fforms happen on it, they will be preferred from all danger by complimenting it with the title of Sea. When it is frozen over, people travel upon it in the road to China; but they must be very sharp shod, otherwise they cannot stand upon the ice, which is exceedingly smooth. Notwithstanding that the ice on this lake is sometimes two ells thick, there are some open places in it to which tempeltuous winds will often drive those who are crossing it, in which case they are irrecoverably loft. The camels that pass along have a particular kind of shoes sharp at bottom, and the oven have sharp irons driven through their hoofs, without which it would be impossible for them to pass. Here are plenty of large flurgeou and pike; with many feals of the black, but none of the sported, kind. It contains feveral islands; and the borders are frequented by black fables and civet cars,

BAIL, BALLIUM, (from the French bailler, which comes of the Greek saxaur, and figuilies to deliver into hands), is used in our common law for the freeing or fetting at liberty of one arrefted or imperioned upon

any action, either civil or criminal, in thresty taken for his appearance at a day and place certains.

The reason why it is railed band, is because by this means the party restrained is delivered into the hands of those that bind themselves for his forthcoming, in order to lafe keeping or protection from prilon i and the end of bail is to latisfy the condemnation and colls, or render the defendant to prilon.

With respect to bail in civil cases, it is to be obferved, that there is both common and special bail, Common bail is in actions of small concernment, being called common, because any fureties in that case are taken; whereas in causes of greater weight, as actions upon bonds, or speciality, &c. where the debt amounts to 101. special bail or surety must be taken, fuch as fubfidy men at least, and they according to the

The commitment of a person being only for fafe custody, wherever bail will answer the same intention, it ought to be taken; as in most of the inferior crimes: but in felonies, and other offences of a capital nature, no bail can be a fecurity equivalent to the actual custody of the person. For what is there that a man may not be induced to forfeit to fave his own life? and what fatisfaction or indemnity is it to the public. to feize the effects of them who have bailed a murderer, if the murderer himfelf be fuffered to escape with impunity? Upon a principle fimilar to which, the Atheman magistrates, when they took a folemn oath never to keep a citizen in bonds that could give three fureties

Baduff.

Bail. of the fame quality with himfelf, did it with an exseption to fuch as had embezzled the public money, or

een guilty of treasonable practices.

Bail may be taken either in court, or, in fome partxular cases, by the sheriff or other magistrate; but methly used by the justices of the peace. To refuse or belay to bail any person bailable, is an offence against the liberty of the subject, in any magistrate, by the common law; as well as by the flatute Westm. r. 3 Edw. I. c. 15. and the habers corpus act, 31 Car. II. c. 2. And, left the intention of the law should be frustrated by the justices requiring bail to a greater amount than the nature of the cafe demands, it is exprefsly declared by flatute I W. and M. ft. 2. c. 1. that excellive bail ought not to be required; though what hail shall be called excessive, must be left to the courts, on confidering the circumstances of the case, to determine. And on the other hand, if the magistrate takes infufficient bail he is liable to be fined, if the crimidal doth not appear.

In civil cases, every defendant is bailable. But it is

otherwife in

Criminal matters. Regularly, all offences, either against the common law or act of parliament, that are below felony, the offender ought to be admitted to bail unless it be prohibited by some special act of parliament.-By the ancient common law, before and fince the Conquest, all felonies were bailable, till murder was excepted by flatute; so that persons might be admitted to bail almost in every case. But the statute West. 1. 3 Ed. I. c. 15. takes away the power of bailing in treason, and in divers instances of sclony. The flatures 25 Hen. VI. c. 9, and 1 and 2 Ph. & Mar. c. 13. gave further regulations in this matter: and upon the whole we may collect, that no juffices of the peace can bail, t. Upon an acculation of treason: nor, z. Of murder past, 3. In case of manslaughter, if the prisoner be clearly the slayer, and not barely suspected to be so, or if any indictment be found against him; nor, a. Such as, being committed for felony, have broken prison; because it not only carries a prefumption of guilt, but is also superadding one sclony to apother : 5. Persons outlawed a 6 Such as have abjured the realm ? Persons taken with the mainour, or in the fact of felony : 8. Persons charged with arson: 9. Excommunicated persons, taken by writ de excommunicato capiendo: all which are clearly not admissible to bail by the justices. Others are of a dubious nature; as, 10. Thieves openly defamed and known: 11. Persons charged with other felonies, or manifest and enormous offences, not being of good fame: and, 12. Accessories to felony, that labour under the same want of reputation. These seem to be in the discretion of the justices, whether bailable or not. The last class are such as muff be bailed upon offering fufficient furety; as, 13. Persons of good same, charged with a bare suspicion of manslaughter, or other infamous homicide: 14. Such persons being charged with petit larceny or any felony, not before specified: or, 16. With being accessory to any felony. Lastly, It is agreed, that the court of king's bench (or any judge thereof in time of vacation) may bail for any crime whatfoever, be it treason, murder, or any other offence, according to the circumstances of the case. And herein the wisdom of the law is very

manifest. To allow bail to be taken commonly for fuch enormous crimes, would greatly tend to clude the public juffice; and yet there are cases, though they rarely happen, in which it would be hard and unjust to confine a man in prison, though accused even of the greatest offence. The law has therefore provided one court, and only one, which has a diferetionary power of bailing in any cafe: except only, even to this high jurifdiction, and of course to all inferior ones, such persons as are committed by either house of parliament, fo long as the fession lasts; or such as are committed for contempts by any of the king's superior courts of justice. See Law, Part III. No xxxvi. 42.

Clerk of the Bails, is an officer belonging to the court of the king's bench : he files the bail pieces taken in that court, and attends for that purpose.

BAIL, or BALE, in the fea language. The feamen call throwing the water by hand out of the ship's or boat's hold, bailing. They also call those hoops that

bear up the tilt of a boat, its bails.

BAILIE, in Scots law, a judge anciently appointed by the king over fuch lands not erected into a regality as happened to fall to the crown by forfeiture or otherwise, now abolished. It is also the name of a magistrate in royal boroughs, and of the judge appointed by a baron over lands erected into a barony. See Law, Part III. No exviii. 6, 7.

BAILIFF (balleous), from the French word bayliff, that is, prafectus provincie; and as the names, for the office itself was answerable to that of France; where there are eight parliaments, which are high courts from whence there lies no appeal, and within the precincts of the feveral parts of that kingdom which belong to each parliament there are feveral provinces to which juffice is administered by certain officers called bailiffs; and in England there are several counties in which justice hath been administered to the inhabitants by the officer who is now called fheriff or viscount (one of which names descends from the Saxons, the other from the Normans); and though the sherist is not called bailiff, yet it is probable that was one of his names also, because the county is often called balliva. And in the flatute of Magna Charta, cap. 28. and 14 Ed. III. c. 9. the word baliff feems to comprife as well theriffs as bailiffs of hundreds. As the realm is divided into counties, fo every county is divided into hundreds; within which in ancient times the people had juffice ministered to them by the officers of every hundred. But now the hundred courts, except certain franchifes, are swallowed in the county-courts; and the bailiff's name and office is grown into contempt, they being generally officers to ferve writs, &c. within their liberties. Though, in other respects, the name is still in good effeem: for the chief magistrates in diverc towns are callled bailiffs or bailies; and fumetimes the persons to whom the king's castles are committed are termed bailiffs, as the bailiff of Dover Cafile, &c.

Of the ordinary bailiffs there are several forts, viz. theriff's bailiffs, bailiffs of liberties, &c.

Sheriff's bailiffs, or theriff's officers, are either bailiffs of hundreds, or special bailiffs. Bailiffs of hundreds are officers appointed over those respective districts by the sheriffs, to collect fines therein; to summon juries; to attend the judges and juffices at the affizes, and quarter-sessions; and also to execute writs and process in \mathbf{B}

Balliss the several hundreds. But as these are generally plain men, and not thoroughly skilful in this latter part of their office, that of ferving writs, and making arrefts and executions, it is now usual to join special bailiffs with them; who are generally mean perfons employed by the theriffs on account only of their advoituels and

dexterity in hunting and feizing of their prey.

Bailiffs of liberties are those bailiffs who are appointed by every lord within his liberty, to execute process, and do fuch offices therein as the bailiff errant doth at large in the county ; but baileffs errant or itinerant, to go up and down the county to ferve process, are out of use.

There are also bailiffs of forests, and bailiffs of manois, who direct hulbandry, fell trees, gather reats,

pay quit-rents, &c.

Water-Ballies, an officer appointed in all porttowns, for the fearching of thips, gathering the toll for anchorage, &c. and arrefting perions for debt, &c. on

the water.

BAILII (David), painter of perspective views and portraits, was the fon of Peter Ballii, an artift of some note; and was born at Leyden in 1584. From his father he learned to draw and defign: but he was afterwards placed under the care of Adrian Verburg, and continued with him for some time; and when he quitted that mafter, he fludied to much greater advantage with Cornelius Vandervoort, an excellent portrait painter, and with him he spent above fix years. As Vandervoort possessed many capital paintings of some great matters, Bailu, for his own improvement, copied them with critical care and observation, and particularly copied one perspective view of the inside of a church originally painted by Stenwyck, which he finished with such accuracy, that even Stenwyck himfelf could scarce determine which was the original, or which the copy, when both were placed before him. He travelled through feveral parts of Italy to fee the works of the celebrated mafters of that country, and for si few years refided at Rome; and abroad, as well as in his own country, the correctness of his drawing, and the delicate handling and fmishing of his pictures, procared him employment, admirers, and friends. In the latter part of his life he discontinued painting, and only drew portraits on vellum with a pen, which he heightened with black lead, and gave them wonderful torce and roundness. He died in 1648.

BAILIWICK, that liberty which is exempted from the sheriff of the county; over which liberty the lord thereof appoints his own bailiff, with the like power within his precinct as an under thereff exercises under the theriff of the county; or it figurities the precise of a bailiff, or the place within which his jurisdiction is

terminated.

BAILLET (Adrian), a very learned French wri-r and common in 1649 at the village of Neuville near Beau Picardy. His parents were too poor to give him a proper education, which however he obtained by the savour of the bishop of Beauvais, who afterwards prefented him with a small ricarage. In 21680, he was appointed librarian to M. de Lamoignon advocate-general to the parliament of Paris; of whose Eibrary the made a copions index in 35 vols. folio, all written with his own hand. He died in 1706, after writing many works, the principal of which are, A Hiflory of Holland from 1600, to the peace of Nimeguen in Bailleul 1679, 4 vols. 12mo; Lives of the Saints, 3 vols. folk, Bambridge which he professed to have purged from fables; Juge-Bambridge mens des Sgavans, which he extended to 9 vols. 12mg; and The life of Des Cartes, 2. vols. 4to, which he abridged, and reduced to 1 vol. 12mo.

BAILLEUL, a town of France, in the carldon of Flanders, formerly very ftrong, but now without any fortifications. It has been feveral times bornt by accident, and contains now only about 500 houses. E.

Long. 2. 55. N. Lat. 40. 35.

BAILMENT, in law, is a delivery of goods in truft, upon a contract, expressed or implied, that the truft shall be faithfully executed on the part of the bailee. As if cloth be delivered, or (in our legal dislect) bailed, to a tailor to make a fact of clothes, he has it upon an implied contract to render it again when made, and that in a workmanly manner. If money or goods be delivered to a common carrier to convey from Oxford to London, or from Glasgow to Edinburgh, &c: he is under a contract in law to pay, or carry them to the person appointed. If a horse or other goods be delivered to an inn-keeper or his ferwants, he is bound to keep them sufely and restore them when his guest leaves the house. If a man takes in a horse, or other cattle, to graze and depasture in his grounds, which the law calls agiftment, he takes them upon an implied contract to return them on demand to the owner. If a pawnbruker receives plate or jewels as a pledge or lecurity for the repayment of anoncy lent thereon at a day occupate, he has them upon an express contract or condition to reffere them if the pleager performs his part by reasoning them in due time; for the the execution of which contract, many useful regulations are made by that the profite of L. 2.4. And so, if a landford different goods different, or a parish officer for taxes, these flow a parish officer for taxes, these flow are profited by an implied contract in law to retire their management of the debt, sury, and expenses, before the interest of the contract in law to retire the interest of the contract in law to retire the interest of the debt, sury, and expenses, before the interest of the debt, sury, and expenses, before the interest of the debt, they are the original of the debt, they are the original of the debt. ceiver is bound to relieve it on demand: and it was formerly held, that in the mean time he was answerable for any damage or loss it wall fulfain, whether by accident or otherwise; unless he expressly undertook to lecep it only with the lame care as his own goods, and then he should not be answerable for thest or other accidents. But now the law feems to be fettled on a much more rational footing withat fuch a general bailment will not charge the bailes with any loss, unless it happens by grofs neglect, which is construed to be an evidence of fraud : but if the bailce undertakes specially to keep the goods fafely and securely, he is bound to answer all perils and damages that may befal them for want of the same care with which a prudent man would keep his own.

BAILO: thus they flyle at Conflantinople the amhallador of the republic of Venice, who refides at the Porte. This minister, besides his political charge, acts

there the part of a conful of Venice.

BAINBRIDGE (Dr John), an eminent physician and aftronomer, born at Ashby de la Zouch in Leicestershire, in 1582. He taught a grammer school for some years, and practifed physic, employing his lessure

B. jalus

Baiecao hours in astronomy, which was his favourite study : at length he removed to London, was admitted a fellow Battion. Tof the college of physicians, and raised his character by his accomption of the comet in 1618. The next year Sa Henry Savile appointed him his first professor of altronomy at Oxford; and the masters and fellows of Marton college made him fust junior, and then superior, reader of Linacre's lecture. He died in 1643, having written many works, foinc of which have never been published: but the MSS, are preferred in the library of Truity college, Dublin.

BAIOCAO, a copper coin, current at Rome, and throughout the whole state of the church, ten of which make a julio, and a hundred a Roman crown.

BAIRAM, or BEIRAM, a Turkish word which figuities a solumn feast. The Mahametans have two Bairams, the Great and the Little. The Little Bairam is properly that held at the close of the fast Ramazan, beginning with the first full moon in the following month Shawal. This is called in Arabic Id al Fetz, or the Feast of breaking the Fast ; by European writers, the Turkish Easter, because it succeeds Ramazan, which is their Lent, more usually the Great Boiram, because observed with great ceremony and rejoicing at Constantinople, and through Turkey, for three days, and in Persia for five or fix days, at least by the common people, to make themselves amends for the mortilication of the preceding month. The feast commencing with the new moon, the Mahometans are very forupulous in observing the time when the new moon commences; to which purpule, observers are sent to the tops of the highest mountains, who the moment they fay the appearance of a new moon, run to the city, and precision Muchdalue, "welcome news;" as it is the figural for beginning the festivity. The Great Bairam, is properly that held by the pilgrims at Mecca, commencing on the tenth of Dhu Ihajia, when the by the dayles and laking three days. This is called by the dayles in all allow, that is, the feelt of facrifice, as being calebrated in memory of the facrifice of Abrim, whole ion God redeemed with a great victim. By European writers it is called the Lefter Bairam, as heing lake taken notice of by the generality of the people, who are not fruck with it, because the ceremonies, it is observed withul, are performed at Mecca, the only scene of the solemnity. On the feast of Bairam, after throwing little floues, one after another, anto the nalley of Mina, they usually kill one or more sheep, fome a goat, bullock, or even a camel; and after giving a part thereof to the poor, eat the rest with their friends. After this, they share themselves. The fecond is a day of reft. On the third, they fet out on their return home.

BAIROUT. See BEEROOT.

BAIT, among fishermen, implies a subflance proper to he fastened to a hook, in order to catch the different farts of fish. See Fishing.

BAITING, the act of smaller or weaker beasts attacking and haraffing greater and flionger. In this sense we hear of the baiting of bulls or boars by mastiffs or bull dogs with short notes, that they may take she better hold.

Utility is pled in justification of hull-baiting. animal is rarely killed without being first baited : the shaffing and exercise whereof makes his slesh tenderer and more digeflible. In reality, it disposes it for putrefaction; fo that, unless taken in time, batted flesh is foon loft. But a spirit of barbarism had the greatoft share in supporting the sport : bulls are kept on purpofe, and exhibited as standing spectacles for the public entertainment. The poor healts have not fair play: they are not only tied down to a stake, with a collar about their necks, and a short rope, which gives them not above four or five yards play; but they are difarmed too, and the tips of their horns cut off, or covered with leather, to prevent their hurting the dogs. In this sport, the chief aim of the dog is to catch the bull by the nofe, and hold him down; to which end he will even creep on his belly: the bull's aim, on the contrary, is, with equal industry, to defend his nose; in order to which, he thrusts it close to the ground, where his horns are also in readiness to toss the dog.-Bull-baiting was first introduced into England as an amusement in the reign of King John, about 1209.

BAJULUS, an ancient officer in the court of the Greek emperors. There were feveral degrees of bajuli; as, the grand bajulus, who was preceptor to the emperor; and the timple bajuli, who were sub-preceptors. The word is derived from the Latin verb bajulare, "to carry or bear a thing on the arms or on the shoulders:" and the origin of the office is thus traced by antiquaries. Children, and especially those of condition, had anciently, befide their nurse, a woman called gerula, as appears from feveral passages of Tertullian; when weaned, or ready to be weaned, they had men to carry them about and take care of them, who were called gerule and bajuli, à gerendo et bajulando. Hence it is, that governors of princes and great lords were ftill denominated bajuli, and their charge or government bajulatio, even after their pupils were grown too big to be carried about. The word passed in the same seple into Greece.

BAJULUS is also used by Latin writers in the several other fenfes wherein BAILIFF is used among us.

BAJULUS was also the name of a conventual officer in the ancient monasteries, to whom belonged the charge of gathering and distributing the money and legacies left for mailes and obits; whence he was also denominated lajulus obituum novorum.

BAKEN, a large and handsome town of Asia in the East Indics, in the kingdom of Ava. E. Long.

108. o. Lat. 19. 35

BAKER (Sir Richard), author of the Chronicle of the Kings of England, was born at Seffingherft, in Kent, about the year 1568. After going through the usual course of academical learning at Hart-hall. in Oxford, he travelled into foreign parts; and upon his return home was created malter of arts, and ioon after, in 1603, received from King James I, the ho-mour of knighthood. In 1620, he was high theriff of Oxfordshire; but engaging to pay some of the debts of his wife's family, he was reduced to poverty, and obliged to betake himfelf for shelter to the Fleet prison, where he composed several books; among which are, 1. Meditations and Disquisitions on the Lord's Prayer. 2. Meditations, &c. on several of the Psalms of David. 3. Meditations, and Prayers upon the feven Days of the Week. 4. Cato Variagatus, or Cato's Moral Diffichs varied, &c .-- Mr Granger observes, that his Chronicle of the Kings of England was ever more eftermed Baket. by readers of a lower class than by such as had a critical knowledge of history. The language of it was, in this reign, called polite; and it long maintained its reputation, especially among country gentlemen. The author feems to have been fometimes more studious to please than to inform, and with that view to have facrificed even chronology itself to method. In 1658, Edward Philips, nephew to Milton, published a third edition of this work, with the addition of the reign of Charles I. It has been several times reprinted fince, and is now carried as low as the reign of George I. Sir Richard also translated several works from the French and Italian; and died very poor, in the Fleet prison, on the 18th of February 1645.

BAKFR (Thomas), an eminent mathematician, was born at Ilton in Somersetshire about the year 1825, and entered at Magdalen hall, Oxon, in:1640; after which he was vicar of Bishop's Nymmet, in Devoitshire, where he wrote The Geometrical Key, or the Gate of Equations unlocked; by which he gained a confiderable reputation. A little before his death, the members of the Royal Society fent him some mathematical queries, to which he returned to fatisfactory an answer, that they presented him a medal with an inscription full of honour and respect. He died at Bi-

shop's Nymmet on the 5th of June 1690.

BAKER (Thomas), a very ingenious and learned antiquary, defeended from a family ancient and well effection, diffinguished by its loyalty and affection for the crown, was born at Crook in 1656. He was educated at the free school at Durham, and thence removed to St John's college Cambridge in 1674. He proceeded B. A. 1677; M. A. 1681; was elected fellow March 1679.80; ordained deacon by Bishop Compton of London December 20. 1685; priest by Bishop Barlow of Lincoln December 19, 1686. Dr Watfon, tutor of the college, who was nominated, but not yet tonsecrated, bishop of St David's, offered to take him for his chaplam, which he declined, probably on the prospect of a like offer from Lord Crew bishop of Durham, which he foon after accepted. His Lordship collated him to the rectory of Long-Newton in his diocese, and the same county, June 1687; and, as Dr Grey was informed by some of the bishop's family, intended to have given him that of Sedgefield, worth bool. or 700l. a-year, with a golden prebend, had he not incurred his displeasure and left his family for refuling to read King James Il.'s declaration for liberty of conscience. The bishop, who disgraced him for this retusal, and was excepted out of King William's pardon, took the oaths to that king, and kept his bishopric till his death. Mr Baker resigned Long-Newton August 1. 1690, refusing to take the oaths; and retired to his fellowship at St John's, in which he was protected till January 20. 1716-17, when, with one and twenty others, he was dispossessed of it. After the passing of the Registering Act 1723, he was defired to register his annuity of 40l. which the last act required before it was amended and explained. Though this annuity, him by his father for his fortune, with 20l. per annum out of his collieries by his elder brother from the day of his death August 1699, for the remaining part of the leafe, which terminated at Whitfuntide 1723, was now his whole subsistence, he could not be prevailed on to fecure himself against the

act. He retained a lively refentment of his deprivations; and wrote himself in all his books, as well as in those which he gave to the college library, focius ejedus, and in some ejedus rettor. He continued to refide in the college as commoner mafter till his death, which happened July 2. 1740, of a paralytic stroke, being found on the floor of his chamber. In the safe ternoon of June 29, being alone in his chamber, he was ftruck with a flight apoplectic fit; which abating a little, he recovered his fenses, and knew all about him, who were his nephew Burton, Drs Bedford and Heberden. He feemed perfectly fatisfied and refigned; and when Dr Bedford defired him to take some medicine then ordered, he declined it, faying, he would only take his usual sustenance, which his bedinaker knew the times and quantities of giving: he was thankful for the affection and care his friends showed him; but, hoping the time of his diffolution was at hand, would by no means endeavour to retard it. His diforder, increased, and the third day from this scizure he departed. Being appointed one of the executors of his eldelt brother's will, by which a large fum was bequeathed to pious uses, he prevailed on the other two executors, who were his other brother Francis and the Hon. Charles Montague, to lay out 13 tol. of the money upon an estate to be settled upon St John's college for fix exhibitioners. He likewife gave the college 100l. for the confideration of 61 a-year (then only legal interest) for his life a and to the library several choice books, both printed and Miss medals, and coins; besides what he left to it by his will; which were " all fuch books, printed and MS, as he had, and were wanting there." All that Mr. Baker printed was, 1. " Reflections on Learning, flowing the infufficiency thereof in its feveral particulars, in order to evince the usefulness and necessity of Revelation, Lond. 1709-10."
(which went through eight editions and Mer Boswell, in his "Method of Study," casks it smoog the English classics for purity of style in and, 2. The Preface to Bishop Fisher's Funeral Sermon for Margaret. Countels of Richmond and Derby, 1708; both with out his name. Dr Grey had the original MS of both in his own hands. The latter piece is a fufficient special cimen of the editor's skill in untiquities to make in regret that he did not live to publish his " History of St John's College from the foundation of old St John's house to the present times with some occasional and incidental account of the affairs of the university, and of such private colleges as held communication or intercourse with the old house or college; collected principally from MSS, and carried on through a succession of masters to the end of Bilhop Gunning's mastership, 1670." The original, fit for the prefs, is among the Harleian MSS. No 7028. His MS. collections relative to the history and antiquities of the university of Cambridge, amounting to 39 volumes in folio and three in quarto, are divided between the British Museum and the public library at Cambridge; the former possesses 23 volumes, which he bequeathed to the earl of Oxford, his friend and patron; the latter 16 in folio and three in quarto, which he bequeathed to the university. Dr Knight styles him " the greatest master of the antiquities of this our university;" and Hearne says, Optandum eft ut sua quoque collectanea de antiquitatibus Cantabrigiens fibus juris faciat publici Cl. Bakerus, quippe qui erudiBaker. tione summa judicioque acri et subacto polleat. Mr Baker intended something like an Athena Cantabrigienses, on the plan of the Athena Oannienfer.

BAKER (Heavy), an ingenious and diligent naturalift, was born in Fleet-street, London, either near the end of the last, or very early in the beginning of the prefent, century. His father's profession is not known; but his mother was, in her time, a midwife of great practice. He was brought up under an eminent bookfeller who preceded the elder Dodfley in the business of a bookseller; in which, however, he appears not to have engaged at all after his apprenticeflip; or, if he did, it was foon relinquished by him: for though it was in his power to have drawn away all his mafter's best customers, he would not set up against him. Mr Baker being of a philosophical tuen of mind, and having diligently attended to the methods which might be practicable and useful in the cure of flammering, and especially in teaching deaf and dumb persons to speak, he made this the employment of his life. In the profecution of so valuable and difficult an undertaking, he was very successful; and several of his pupils, who are still living, bear testimony to the ability and good effect of his instructions. He married Sophia, youngest daughter to the famous Daniel Defoe, who brought him two fone, both of whom he furvived. On the 20th of January 1740 Mr Baker was elected a fellow of the Society of Autiquaries; and, on the 12th of March following, the same honour was conferred upon him by the Royal Society. In 1744, Sir Godfrey Copley's gold medal was bestowed upon him, for having, by his microscopical experiments on the cryfishizations and configurations of faline particles, produced the most extraordinary discovery during that year. Having led a very uleful and honourable life, be died at his apartments in the Strand on the arth of November 1774, being then above 70 years of age. His wife had been dead fome time before; and he left only one grandfou, William Baker, who was born February 17. 1763, and to whom, on his wing to the age of at he bequeathed the bulk of his forcuse, which he had acquired by his profession teaching deaf and dumb persons to speak. His furnigare, printed books (but not MSS.), curiofities and collections of every fort, he directed should be fold, which was accordingly done. His fine collection of native and foreign fossils, petrifactions, shells, corals, vegetables, ores, &c. with some antiquities and other curiofities, were fold by auction March 13, 1775, and . the nine following days. He was buried as he defired in an unexpensive manner, in the churchyard of St Mary-le-strand; within which church, on the fouth wall, he ordered a small tablet to be erected to his memory. " An inscription for it (he said) would probably be found among his papers; if not, he hoped fome learned friend would write one agreeable to truth." This friendly office, however, remains as yet to be performed. Mr Baker was a constant and useful attendant at the meetings of the Royal and Antiquarian Societies, and in both was frequently chosen one of the council. He was peculiarly attentive to all the new improvements which were made in natural science, and very folicitous for the profecution of them. Several of his communications are printed in the Philosophical Transactions; and, besides the papers writ- Bakw. ten by himfelf, he was the means, by his extensive correspondence, of conveying to the Society the intelligence and observations of other inquititive and philo-Tophical men, both at home and abroad. The Society for the encouragement of arts, manufactures, and commerce, is under fingular obligations to our worthy naturalist. As he was one of the earliest members of it, so he contributed in no small degree to its rife and establishment. At its first institution he officiated for some time gratis as secretary. He was many years chairman of the committee of accounts; and he took an active part in the general deliberations of the Society. He drew up a short account of the original of this fociety, and of the concern he himfelf had in forming it; which was read before the fociety of antiquaries, and would be a pleasing present to the public. Mr Baker was a poetical writer in the early part of his life. His Invocation of Health got abroad without his knowledge; but was reprinted by himfelf in his Original Poems, ferious and humorous, Part I. 8vo. 1725. Part II. came out in 1726. Among thefe poems are some tales as witty and as loose as Prior's. He was the author likewise of The Universe, a poem intended to restrain the pride of man; which has been feveral times reprinted. His account of the water polype, which was originally published in the Philosophical Transactions, was afterwrds enlarged into a separate treatife, and hath gone through feveral editions. But his principal publications are, The Microscope made Eafy, and Employment for the Microscope. The first of these, which was originally published in 1742 or 1743, hath gone through six editions. The second edition of the other, which, to fay the least of it, is equally pleasing and instructive, appeared in 1764. These treatises, and especially the latter, contain the most curious and important of the observations and experiments which Mr Baker either laid before the Royal Society or published separately. It has been faid of Mr Baker, that he was a philosopher in little things. If it was intended by this language to lessen his reputation, there is no propriety in the flricture. He was an intelligent, upright, and benevolent man, much respected by those who knew him best. His friends were the friends of science and virtue: and it will always be remembered by his contemporaries, that no one was more ready than himself to assist those with whom he was conversant in their various researches and endeavours for the advancement of knowledge and the benefit of fociety.

BAKER (David-Erskine), son to the former, was a young man of genius and learning. Having been adopted by an uncle, who was a filk-throwfter in Spitalfields; he fucceeded him in the bufiness; but wanted the prudence and attention which are necessary to fecure prosperity in trade: He married the daughter of Mr Clendon, a reverend empiric. Like his father, he was both a philosopher and a poet; and wrote several occasional poems in the periodical collections, some of which were much admired at the time; but so violent was his turn for dramatic performance, that he repeatedly engaged with the lowest strolling companies, in spite of every effort of his father to reclaim him. The public was indebted to him for " The Companion to Baker the Playhouse," in two volumes, 1764, 12mo; a work which, though imperfect, had confiderable merit, and showed that he possessed a very extensive knowledge of our dramatic authors; and which has fince (under the title of " Biographia Dramatica") been confiderably improved by the attention of a gentleman in every respect well qualified for the undertaking.

> BAKER, a person whose occupation or business is to bake bread. See the articles BAKING and BREAD. The learned are in great doubt about the time when baking first became a particular profession and bakers were introduced. It is however generally agreed, that they had their rife in the east, and passed from Greece to Italy after the war with Pytrhus; about the year of Rome 583. Till which time every housewife was her own baker ; for the word piffor, which we find in Roman authors before that time, fignified a person who ground or pounded the grain in a mill or mortar to prepare it for baking, as Varro observes. According to Athenaus, the Cappadocians were the most applauded bakers, after them the Lydians, then the Phoenicians .- To the foreign bakers brought into Rome, were added a number of freed men, who were incorporated into a body, or, as they called it, a tollege; from which neither they nor their children were allowed to withdraw. They held their effects in common, and could not dispose of any part of them. Each bakehouse had a patronus, who had the superintendence thereof; and these patroni elected one out of their number each year, who had superintendence over all the refl, and the care of the college. Out of the body of the bakers every now and then one was admitted among the fenators .- To preferve honour and honefft in the college of bakers, they were expressly prohibited all alliance with comedians and gladiators; each had his shop or bakehouse, and they were distributed into fourteen regions of the city. They were excused from guardianships and other offices, which might divert them from their employment .- By their own statutes hakers are declared not to be handicrafts. No man for using the mysteries or sciences of baking, brewing, furgery, or writing, shall be interpreted a handicraft. The bakers were a brotherhood in England before the year 1155, in the reign of King Henry II. though the white bakers were not incorporated till 1307, by King Edward III. and the brown bakers not till 1621. in King James I.'s time. Their hall is in Harplane. Thames street; and their court day on the first Monday of the month .- They make the 19th company and confilt of a warden, 4 mafters, 30 affiltants, and 140 men on the livery, belides the commonalty. The French had formerly a great baker, grand ponesier de France, who had the Superintendency of all the bas kers of Paris. But fince the beginning of this refitury, they have been put under the juridiction of the lieutenant-general de police. In fome provinces of France, the lord is the only baker in his feigheury; keeping a public oven, to which all the tenants are obliged to bring their bread. This right is called furnagium or furnatioum, and makes part of the bannalite.

BAKEWELL, a pretty large town of Derbyshire in England, seated on the river Wye, on the northfide of the Peak. It has a confiderable trade in lead. W. Long. 2. 30. N. Lat. 55. 15.

BAKING, the art of preparing bread, or reducing

meals of any kind, whether simple or compound, into Baking Bread. See the article BREAD.

The various forms of baking among us may be reduced into two, the one for unleavened, the other for leavened bread. For the first, the chief is manchetbaking: the process whereof is as follows: The meal, ground and boulted, is put into a trough; and to every bushel are poured in about three pints of warm ale, with barm and falt to feafon it. This is kneaded well together with the hands through the brake; or, for want thereof, with the feet, through a cloth: after which, having lain an hour to fwell, it is moulded into manchets; which, fcorched in the middle, and pricked up at top, to give room to rife, are baked in the oven by # gentle fire .- For the fecond, fometimes called cheatbread briking, it is thus: Some leaven (saved from a former batch) filled with falt, laid up to four, and at length diffolved in water, is strained through a cloth into a hele made in the middle of the heap of meal in the trough i then it is worked with some of the flour into a moderate confistence; this is covered up with meah where it lies all night; and in the morning the whole heap is Rifred up, and mixed with a little warm water, barm, and fair, by which it is fealened, loftened, and brought to an even leaven: it is then knead. ed, moulded, and baked, as before.

ed, and brouger to an even leavent it is even knowled, and brouger to an even leavent it is even knowled, and baked, as before.

Method of railing a logicl of flower with a tea-foonful of barm; by Junies stokes of elaport, is Hampfoire.

—Suppose you want to below, of elaport, is Hampfoire.

—Suppose you want to below, a bushel of flour, and have but one tea spoonfal of bares. Put your flour into your kneeding trough or transles, then take about three quarters of a plant of flower want, and take the rea-spoonfal of thick the flower want put it into the water, fir it until it is this toke the stoke with the water: then make a hole in the middle of the flour large enough to contain two galling of water, from in your small quantity; then take a light those, who for large (which you may keep for the light those we feet large (which you may keep for the light those we feet large for a pudding; then first brough for a large water water and go about your usual bushels is allowed as how we will had that large part of the flower of the flower of water water have some flower it; and when you want first as before, and fir in some more flour, until it is as thick as before, and the in some flower dry flower over it, and leave it so two finke fome more dry flour over it, and leave it for two hours more, and then you will find it the and break through the dry flour again; then you may add three quarts of a gallon of water more, and fir in the flour and make it as thick as at first, and cover it with dry sour again; in about three or four hours more you may mix up your dough, and then cover it up warm; and in four or five hours more you may put it into the oven, and you will have as light bread as though you had put a pint of barm. It does not take above a quarter of an hour more time than the usual way of baking, for there is no time loft but that of adding water three or four

The author of this method affures us that he constantly bakes this way in the morning about fix or feven o'clock, puts the flour out, and puts this small quantity of barm into the before-mentioned quantity of water, in an hour's time some more, in two hours more

Baking, a greater quantity, about noon makes up the dough, and about fix in the evening it is put into the oven, and he has always good bread, never heavy nor bitter.

> When you find, he fays, your body of flour fponged large enough, before you put in the reft of your water, you should, with both your hands, mix that which is Ipunged and the dry flour altogether, and then add the remainder of warm water, and your dough will rife the better and caffer.

> The reason he assigns why people make heavy bread is, not because they have not barm enough, but because they do not know that barm is the same to flour as fire is to fuel; that, as a spark of fire will kindle a large body by only blowing of it up, so will a thimblefull of barm, by adding of warm water, raife or fponge any body of flour; for warm water gives fresh life to that which is before at work; fo that the reason of making bread heavy is, because the body sponged is not large enough, but was made up and put into the oven before it was ripe.

> In regard to the difference of featons, be preferibes, that in the fummer you should put your water bloodwarm; and in winter, in cold frofty weather, as warm as you can bear your hand in it without making it fmart; heing fure you cover up your dough very warm in the winter, and your covering of it with dry flour every time you add warm water, will keep in the heat; when you have added fix or eight quarts of warm water, as before mentioned, in such a gradual way, you will find all that being of flour which is mixed with the warm water, by virtue of that one tea-spaonful of barm, brought into great agitation, waxing or fermenting; for it is to the flour what the spirit is to the body, it foon fills it with morning.

BARQU, or Bazu, a town of Persa, in the province of Subvan, hearted at the extremity of the gulf of Ghilin on the Calella fea. It is effected the most lecurely at anchor in level fathom water; but the number of mosts, illands, and fand banks, render the entrance in Jome places extremely difficult and danger-Sie, particularly to the Roffinis, who are pet very ex-pert failors. Bake is a ferticul furrounded with high brick walls, its isliabitance like those of Derbent, are Persians, Tartars, and a few Armenian merchants. The principal articles of exportation which support the trade of this place are naphtha, and the finest rock falt, of both which there are miser on the east fide of the bay. The inhabitants cultivate fallron and the coston tree, but not to any confiderable advantage. The trade of Baku, though more valuable than that of Derbest, is still inconsiderable, and chiefly carried on with Shamakee, from whence it draws raw filk and filken fluffs. A Russian consul is resident at this place. In 1777 Baku belonged to Melik-Mehmed, who was tributary to Feth Ali, khan of Kuba: the latter possessed the whole province of Shirvan, and was the most powerful prince, next to the khan of Ghilan, upon the coast of · the Calpian. Before we quit the province of Shirvan, it may not be improper to mention its capital the inland town of Shamakee, which is only 66 miles from Baku, and supplies that port with raw filk and filken stuffs. It owed its former commercial importance to the filk which is cultivated in the neighbouring difirst; this rich production fill preserves the town from Vol. II. Part II.

ruin; though its traffic is greatly reduced by the ex- Balaam. orbitant exactions of the khan of Kuba. Formerly the Rushians had a factory at this place; and it was also crowded with Turkish and Greek merchants; but at present there are only a few Armenian and Indian traders. The inhabitants manufacture filk and cotton fluffs, but far inferior to those made at this place in the beginning of the prefent century. The filk of this province is exported into the interior part of Persia, Turkey, Georgia, and Russia. E. Long. 51. 30. N. Lat. 40. 20.

BALAAM, a prophet and diviner of the city of Pethor upon the Euphrates, whose practices with Balak king of the Moabites are recorded in the book of Numbers, chap. xxii. It is a question much debated among divines, whether Balaam was a true prophet of God, or no more than a magician or fortune-teller. The Tews indeed are generally of opinion, that he was a buly and pretending aftrologer, who, observing when men were under a bad aspect of the flars, pronounced a curle upon them; which fometimes coming to pais, gained him in fome neighbouring nations a reputation in his way. Several of the ancient fathers supposed him to be no more than a common foothfaver, who undertook to tell future events, and discover fecrets, and by no very jultifiable aits. Origen will needs have it, that he was no prophet, but only one of the devil's forcerers, and that of him he went to inquire; but that God was pleased to prevent him and put what answers he pleased into his mouth. It cannot be denied, however, that the feripture expecialy calls him a prophet (2 Pet. ii. 15.); and therefore some later writers have imagined that he had once been a good man and true prophet, till loving the wages of iniquity, and profittuting the honour of his office to coveroussels, he apostatized from God, and betaking himself to idolatrous practices, fell under the delaston of the devil, of whom he learned all his magical enchantments, though at this juncture, when the prefervation of his people was concerned, it might be confident with God's wildom to appear to him, and vouchfafe his revelations. As to what passed between him and his ass, when that animal was miraculously enabled to fpeak to its mafter, commentators are divided in their opinions concerning this fact, whether it really and literally happened as Mofes relates it; or whether it be an allegory only, or the mere imagination or vision of Balanm. This indeed is fo wonderful an inflance, that several of the Jewish doctors, who upon other occaffore are fond enough of miracles, feem as if they would hardly be induced to affent to this. Philo, in Big Life of Mofer paffes it over in filence; and Maimenides pretends that it happened to Balaam in a prophetic vision only. But St Peter (2 Pet. ii. 16.) frenks of this fact as literal and certain, and fo all interpreters explain it. St Austin, who understands it exactly according to the letter, finds nothing in the whole account more furprising than the stupidity of Balaam, who heard his als speak to him, and answered it as if he talked with a reasonable person. He is of opinion, that this diviner was acoustomed to prodigics like this, or that he was strangely blinded by his avarice not to be stopped by an event of so extraordinary a nature. Le Clerc thinks, that Balaam might probably have imbibed the doctrine of transmigration of fouls,

Baham fouls, which was certainly very common in the east; and from thence he might be the less aftonished at hearing a brute speak. And Dr Patrick thinks that Balasm was in such a rage and fury at the supposed perverlenels of his beatt crushing his foot, that for the present he could think of nothing else; though the concidencis of Moles's relation, who must be prefumed to have omitted many circumflances, which if rightly known would dispel this and many more difficulties that may be imagined in this transaction, does certainly furnish us with a better and more satisfactory anfwer. St Austin is of opinion, that God had not given the als a reasonable soul; but permitted it to pronounce certain words, in order to reprove the prophet's covetoulnels. Gregory of Nyssa seems to think that the afs did not utter any word articulately or diflinctly; but that, having brayed as usual, the diviner, whose practice it had been to draw prefages from the cries of beafts and finging of birds, comprehended eafily the afs's meaning by its noise; Moses, defighing to ridicule this superstitious art of augurs and soothlayers, as if the afs really spoke in words articulate.

> We must own, says Calmet, that this is a miraculous fact related by an inspired writer, whose authority we me not allowed to call in question in the least particular; but we should study such ways of explaining it as are most conformable to reason, and most proper to folve the difficulties of it, without attacking the truth of the hiftory. Now it is very possible for God to make an afs fpeak articulately; it is indeed miraculous, and above the ordinary faculty of this animal, but not against

the laws of nature.

BALADAN, the scripture name for a king of Babylon (Ifa. xxxix. 1. 2 Kings xx. 12.), called by profane authors Belefus or Belefis, Nabonaffar or Nanybrus. Baladan at first was no more than governor of Bubylon; but entering into a confederacy with Arbaces governor of Media, and rebelling against Sardanapalus king of Affyria, thefe two generals marched against him with an army of 400,000 men, and were heat in three different battles. But the Bactrians deterting the king, and coming over to Baladan and Arbaces, the rebels attacked the enemy in the night, and made themselves masters of his camp. After this misfortune, Sardanapalus retreated to Nineveh, and left the command of his army to his brother-in-law Salamenes. The conspirators attacked Salamenes, and defeated him in two great battles; after which they haid fiege to Ninevch. Sardanapalus fultained the fiege for three years; but the Tigris, in the third year, overflowing its banks, beat down 20 furlongs of the walls; whereupon the conspirators entered the city and took possession of it, after Sardanapalus had burnt himself and all his most valuable effects upon a funeral pile erected for that purpose in his palace. Baladan was acknowledged king of Babylon as Arbaces was of Media. Berodach-baladan, who sent ambassadors to Hezekiah (2 Kings xx.), was the fon of Baladan.

BALA, a town of Merionethshire in Wales. W.

Long. 3. 37. N. Lat. 52. 54.

BALÆNA, or WHALE, in zoology, a genus of the mammalia class, belonging to the order of cete. The characters of this genus are thefe: The bakena, in place of teeth, has a horny plate on the upper jaw, and a

double fiftula or pipe for throwing out water. The Bulæna. fpecies are four, viz'

1. The mysticetus, or common whale, which has I Common many turnings and windings in its nostrils, and has no whale. fin on the back. This is the largest of all animals; it is even at prefent fometimes found in the northern feas 90 feet in length: but formerly they were taken of a much greater fize, when the captures were less frequent, and the fifth had time to grow. Such is their bulk within the arctic circle; but in those of the torrid zone, where they are unmolefted, whales are still feen 160 feet long. The head is very much disproportioned Description to the fize of the body, being one-third the fize of the &c. fish: the under lip is much broader than the upper. The tongue is composed of a soft spongy fat, capable of yielding five or fix barrels of oil. The gullet is very small for so wast a fish, not exceeding four inches in width. In the middle of the head are two orifices, through which it fpouts water, to a vast height, and with a great noise, especially when disturbed or wound. ed. The eyes are not larger than those of an ox, and when the crystalline humour is dried, it does not appear larger than a pea. They are placed towards the back of the head, being the most convenient situation for enabling them to fee both before and behind; as also to

fee over them, where their food is principally found.

They are guarded by eyelids and cyclames, as in qua-

drupeds; and they feem to be very tharp-fighted. Nor is their lense of hearing in less perfection; for they are warned at great diffusions of any danger preparing against them. It would seem as if nature had delignedly given them their advantages, as they multiply little, in order to continue their kind. It is true, indeed, that the external organ of hearing is not perceptible, for this might only embarrals them in their natural element; but as loose as the thin fearf-ikin after mentioned is removed, a black spot is discovered behind the eye, and under that is the auditory canal, that leads to a regular apparatus for hearing. In fact, the animal hears the imallest founds at very great distances, and at all times, except when it is spouting water; which is the time that the fishers approach to firine it. What is called minalebone, adheres to the upper jaw; and is formed of thin parallel laming, some of the longest four yards in length : of these there are commonly 350 on each fide, but in very old fish more; about 500 of them are of a length fit for use, the others being too foort. They are farrounded with long strong hair, not only that they may not hurt the tougue, but as Arginers to prevent the return of their food when they discharge the water out of their mouths .- The real bones of the whale are hard, porous, and full of marrow. Two great strong bones fusian the upper lip, lying against each other in the shape of a half

The tail is broad and femilunar; and when the fish lies on one fide, its blow is tremendous. The tail alone it makes use of to advance itself forward in the water; and it is surprising to fee with what force and celerity is enormous bulk cuts through the ocean. The fins are only made use of for turning in the water, and giving a direction to the velocity impressed by the tail, The female also makes use of them, when pursued, to bear off her young, clapping them on her back, and **fupporting** Balana. Supporting them by the fins on each side from falling. The whale varies in colour; the back of fome being red, the belly generally white. Others are black, fome mottled, others quite white; according to the observation of Martin, who fays, that their colours in the water are extremely beautiful, and that their skin is very fmooth and flippery. The outward or fearf-fkin of the whale is no thicker than parchment; but this removed the real skin appears, of about an inch thick, and covering the fat or blubber that hes beneath: this is from eight to twelve inches in thickness; and is, when the fifth is in health, of a beautiful yellow. The muscles lie beneath; and thefe, like the flesh of quadrupeds, are very red and tough. The penis is eight feet in length, enclosed in a strong sheath. The teats in the female are placed in the lower part of the belly.

Autual fitale and male.

In copulation, the female joins with the male, as is chty of the afferted, more humano; and once in two years feels the accelles of defire. Their fidelity to each other exceeds whatever we are told of, even the constancy of birds. Some fifthers, as Anderson informs us, having struck one of two whales, a male and a female, that were in company together, the wounded fish made a long and terrible reliftance : it ftruck down a boat with three men in it with a fingle blow of its tail, by which all went to the bottom. The other fill attended its companion, and lent it every affiftance; till, at lail, the fift that was ftruck funk under the number of its wounds; while its faithful affociate, diffusining to furvive the loss, with great bellowing, Restched tielf upon the dead fish, and shared his fate. The whale goes with young nine offspring, or ten months, and is then fatter than vival, particu-ction, &c. larly when near the time of bringing forth. It is faid that the embryo, when first perceptible, is about 17 inches long, and white; but the out, when excluded, is black, and about to feet long. She generally produces one young one, and never above two. When she fuckles her young, the throws herfelf on one fide on the furface of the fea, and the young one attaches itfelf to the test.

Nothing can exceed the tendernels of the female for her offening; the carries it with her wherever the goes, and, when hardest purstied, keeps it supported between her fine Even when wounded she still classes her young one; and when the plunges to avoid danger, takes it to the bottom; but rice fooner than usual to give it breath again. The young ones continue at the breaft for a year; during which time, they are called by the failors fort heads. They are then extremely fat, and yield above 50 harrels of blubber. The mother at the same time is equally lean and emaciated. At the age of two years they are called funts, as they do not thrive much immediately after quitting the break; they then yield scarce above 20 or 24 barrels of blubber: from that time forward they are called skull fish,

and their age is wholly unknown.

Every species of whale propagates only with those of its own kind, and does not at all mingle with the reft: however they are generally feen in sheals, of different kinds together, and make their migrations in large companies from one ocean to another. They are gregarious animals; which implies their want of mutual defence against the invalions of smaller, but more powerful, fifthes. It feems aftonishing, therefore, how a shoal of these enormous animals find Subsistence together, when it would feem that the fupplying even Dalens. one with food would require greater plenty than the ocean could furnish. To increase our wonder, we not only fee them herding together, but usually find them fatter than any other animals of whatfoever element. We likewife know that they cannot fwallow large fifties, as their throat is fo narrow, that an animal larger than a herring could not enter. How then do they fubfilt Their food. and grow fo fat? A certain fort of small fnail, or (as | Sec Me-Linnæus fays) the medufa ‡ or fea blubber, is fusicient defe. for this supply. Content with this simple food, it purfues no other animal, leads an inoffentive life in its electroil plives ment, and is harmless in proportion to its strength to note. do mischief.

As the whale is an inoffensive animal, it is not to be wondered that it has many enemies, willing to take advantage of its disposition and inaptitude for combat. There is a small animal, of the shell-fish kind, called Enemies. the whale loufe, that flicks to its body, as we fee shells flicking to the foul bottom of a ship. This infinuates itself chiefly under the fins; and whatever efforts the great animal makes, it still keeps its hold, and lives upon the fat, which it is provided with inftruments to arrive at.

The fword fift ||, however, is the whale's most terrible enemy. "At the fight of this little animal," fays Anderson, "the whale seems agitated in an extraordinary manner; leaping from the water as if with affright: wherever it appears, the whale perceives it at a diffance, and flies from it in the opposite direction. I have been myself," continues he, "a specator of their Corfice terrible encounter. The whale has no instrument of de-with the feace except the tail; with that it endeavours to flrike forord fish, the enemy; and a fingle blow taking place, would effectually destroy its adversary; but the sword fish is as active as the other is strong, and easily avoids the stroke; then bounding into the air, it falls upon its great fubjacent enemy, and endeavours not to pierce it with its pointed beak, but to cut with its toothed edges. The fea all about it is feen dyed with blood, proceeding from the wounds of the whale; while the enormous animal vainly endeavours to reach its invader, and ftrikes with its tail against the furface of the water, making a report at each blow fouder than the noise of a cannon." In calm weather, the fishermen lie upon their oars as spectators of this combat, until they perceive the whale at the last gasp: then they row towards hone and his enemy retiring at their approach, they enjoy the fruits of the victory. This account, however, is differest in feveral respects from that commonly given by feather who report that a fish called the Thresher is in league with the favoriles; and that theformer keeps on the back of the whale, while the latter wounds it underneath in the belly, which occasions him to rife to the furface of the water and to give the thresher an opportunity of assisting in the combat. This he does by throwing himself into an erect posture; and like a boy tumbling neck over heels, falls down with aftonishing force on the back of his prey: And thus they go on till the poor whale is destroyed. The grampus, and other large fishes of the cetaceous order, are attacked and destroyed by the fame enemies in a fimilar manner. The whale has another desperate enemy, a kind of shark, of different fizes from one to three fathoms; fo voracious, that it

Bolava. tears large pieces of flesh from the whale, as if they had been dug with shovels.

10 Ancedotes of the while zi ulc.

To view these animals in a commercial light, we muil observe, that the English were late before they engaged in the whale fifthery: it appears by a fet of queries, proposed by an honest merchant in the year 1575, in order to get information in the bufinels, that we were at that time totally ignorant of it, being obliged to send to Biskaie for men skilful in the catching of the whale, and ordering of the oil, and one cooper skilful to set up the staved cash. This seems very strange; for by the account Ofther gives of his travels to King Alfred, near 700 years before that period, it is evident that he made that monarch acquainted with the Norwegians practifing the whale fithery; but it feems all memory of that gainful employ, as well as of that able voyager Ochher, and all his important discoveries in the north, were loft for near feven centuries.

It was carried on by the Biscayeners long before we attempted the trade; and that for the fake not only of the oil but also of the whalebone, which they feem to have long trafficked in. The earliest notice we find of Hackingt's that article in our trade is by Hackluyt, who fays it God of the was brought from the bay of St Lawrence by an Eng-Lib. 414. lish ship that went there for the barbes and fynnes of whales and train oil, A. D. 1594, and who found there 700 or 800 whale fynnes, part of the cargo of two great Biskaine ships, that had been wrecked there three years before. Previous to that, the ladies stays must have been made of split cane, or some tough wood, as Mr Anderson observes in his Dictionary of Commerce; it being certain that the whale-fishery was carried on, for the fake of the oil, long before the discovery of the use of whalebone.

The great refort of these animals was found to be on the inhospitable shores of Spitzbergen, and the European ships made that place their principal sishery, and for numbers of years were very successful: the English commenced that bufinefs about the year 1598, and the town of Hull had the honour of first attempting that profitable branch of trade. At present it seems to be Ent. 2. d. on the decline, the quantity of fifth being greatly redu-Non 111 53, ced by the conflant capture for fuch a vail length of time: fome recent accounts inform us, that the fishers, from a defect of whales, apply themselves to feal fiftery, from which animals they extract an oil. This we fear will not be of very long continuance; for thefe fly and timid creatures will foon be induced to quit those hores by being perpetually haraffed, as the morfe or walrus has already in a great measure done. We are also told, that the poor natives of Greenland begin even now to tuffer from the decrease of the seal in their seas, it being their principal sublistence; so that, should it totally detert the coath, the whole nation would be in danger of periffing through want.

> In old times the whale feems never to have been taken on our coafts, but when it was accidentally flung athore: it was then deemed a royal fifth, and the king and queen divided the fpoil; the king afferting his right to the head, her majefty to the tail. For the manner of taking wholes, fee Whale FISHERY.

Other fp .-

2. The physalus, or fin-fish, is distinguished from the common whale by a fin on the back, placed very low and near the tell. The length is equal to that of the common kind, but much more flender. It is farnished

with whalebone in the upper jaw, mixed with hairs, Balana, but fhort and knotty, and of little value. The blubber alfo on the body of this kind is very inconfiderable. Thefe circumstances, added to its extreme fiercenel; and agility, which renders the capture very dangerous, caufe the fishers to neglect it. The natives of Greenland, however, hold it in great effeem, as it affords a quantity of fleth which to their palate is very agreeable. The lips are brown, and like a twifted rope: the spout-hole is as it were split in the top of its head, through which it blows water with much more violence. and to a greater height, than the common whale. The fishers are not very fond of seeing it, for on its appearance the others retire out of those seas. Some writers conjecture this species to have been the operator, and physeter, or blowing whale of Oppian, Allian, and Phny : but fince those writers have not left the least defeription of it, it is impossible to judge which kind they meant; for in respect to the faculty of sporting out water, or blowing, it is not peculiar to any one species, but common to all the whale kind. The pay falus inhabits the European and American oceans in feeds upon herrings and other small fish.

3. The boops, or pike-headed whale, has a double pipe in its faout, three fins like the former, and a hard horny ridge on its back. The belly is full of longitudinal folds or ruge. It frequents the northern ocean. The length of that taken on the couft of Scotland, 29 remarked by Sir Robert Sibbald, was 46 feet, and it. greatest circumference 20. This species takes its name from the shape of its nofe, which is narrower and sharper pointed than that of other whales.

4. The musculus has a double pipe in its front, and three fins; the under jaw is much wider than the upper one. It frequents the Scotch coalts, and feeds upon herrings.

Linnaus makes the physeter and delphinus, which are ranked among the whiles by some winers, two difline genera. See Physeres and Delphinus.

BALAGATE, a province of the Mogul empire, and the largest of the three that compose the kingdom of Dekkan. It has Kandish and Barar to the north; Telinga to the east, Baglana with part of Guzerat to the west, and Visiapour to the fouth. It is a fruitful and pleafant country, abounding with cotton and fugar. Here they have theep without horns; but to firing, that when bridled and faddled they will carry boys of ten years of age. Its present capital is Aurungabad, but formerly was Dowlet Abad; and from the latter the whole province is fometimes called Dowlat Abad.

BALAGATE Mountains, a chain of mountains which divides the coast of Malabar from that of Coromandel. running almost the whole length of the peninsula on this fide the Ganges. Some parts of them are covered with fine red earth, which is blown by the strong well winds as far as the island of Ceylon; and when the rays of the fun are reflected from these mountains, they seem to be all on fire. They make surprifing alterations in the feafons; for on the north fide of Cape Comorin, it is winter in May, June, July, August, and September, in which months it is summer on the fouth fide of the cape; on one fide there are continual tempetis, thunder and lightning, while the other enjoys a conflant ferenity. When black clouds are gathered

> BALANCE, or BALLANCE, one of the fix fimple powers in mechanics, principally used in determining the equality or difference of weights in heavy bodies, and confequently their maffes or quantities of matter.

The balance is of two kinds; the ancient and the modern. The ancient or Roman, called also the flatera Romana, or steelyard, consists of a lever or beam, moveable on a centre, and fuspended near one of its extremities: the bodies to be weighed are applied on one fide of the centre: and their weight is flown by the division marked on the beam, where the weight, which is moveable along the lever, keeps the fteelyard in equilibrio. This balance in Mill frequently used in weighing heavy bodies:

The modern balance now generally used consists of a lever or beam fulpended exactly in the middle, having feales or basons hung to each extremity. The lever is called the jugum or beam, and the two moieties thereof on each fide the axis, the brachia or arms. The line on which the beam turns, or which divides its brackia, it called the axis; and when confidered with regard to the length of the brachia, is electmed a point only, and called the centre of the balance; the handle whereby it is held, or by which the whole apparatus is fulpended, is called trutina; and the flender part perpendicular to the beam, whereby either the equilibrium or preponderancy of bodies is indicated, Plate XCI, is called the tongue of the balance. Thus in fig. 3. ab is the beam, divided into two equal brachia or arms by the white spot in the centre, which is the axis or centre of the balance, and e is the tongue. The trutina, on thich the axis is suspended, is not represented in this figure, in order to render the other parts more configuration.

> It follows, from what has been observed, therefore, that in the Roman balance, the weight used for a counterpoife is the fame, but the points of application varies; in the common balance the counterpoise is various, and the point of application the same. . The principle on which each is founded, may be very easily understood from the following observations, and the general properties of the lever. See LEVER.

The beam AB (fig. 6.), is a lever of the first kind;

but instead of resling on a fulcrum, is suipered by Balance fomething fastened to its centre of motion : ankequently the mechanism of the balance depends on the fame theorems as the lever.

Hence as the quantity of matter in known weight is to its distance from the centre of motion, so is the distance of the unknown weight to its quantity of mat-Hence the nature and use of the steelyard is easily known. Let AB (fig. 6.) represent an instrument of this kind; a, the truting, or handle on which the beam turns; &, a ring on which the balance may be suspended on a nail or hook; f, the hook on which the body to be weighed is hung; c, a collar or guard by which the hook f is fastened to the beam; g, a moveable collar; b, a fwivel; i, the counterpoile. From what has been faid it evidently follows, that if the body to be weighed be fallened to the hook /, and the whole suspended by the ring b, the division on which the counterpoile is placed to maintain an equilibrium in the balance, will show the weight of the body required; provided the weight of the counterpoile ile known, and the large divitions, 1, 2, 3, &c. be equal to the distance between the centre of the balance and the ferew which fallens the guard c to the shorter arm of the balance. It will also be necessary that the sheel yard itself, with its whole apparatus, exclusive of the counterpoife, be in equilibrio, when suspended on the ring k. If the body to be weighed be heavier than the divisions on the longer arm will indicate, the balance is turned the lower fide upwards, and fuspended on the other ring b; by which means the divisions become morter, because the distance between the trutina d, and the forew on which the guard a moves, is less the divisions in the figure on this side extending to 17, whereas they extend only to 6 on the other. It will be unnecessary perhaps to observe, that the same precaution, with regard to the centre of gravity when the balance is suspended, is also necessary when this fide of the balance is used, as we before mentioned with regard to the other.

We have already observed, that in the common scales the two brachia or arms of the balance, ef, eg, fig. 4. are equal to each other, and confequently equal weights placed in the scales d, d, will be in equilibris when the balance is suspended on its centre r, as in the figure, where the ring at the extremity of the trutina is hung on the tapering rod a b, fixed in the foot or balls c.

The Decaiful BALANCE, or that which cheat- by the inequality of its brachia, is founded on the tame principle as the fleelyard. Let there be, for example, a balance to confinited, that both the brachia with their toales thall equiponderate, but that the length of the one arm shall be to that of the other as 10 to o. In this cafe, a weight of nine pounds put into the longest arm, will counterpoile one of ten pounds put into the faorter one; but the cheat is immediately discovered by faifting the weight from one scale to the other; me which case, the balance will no longer remain in equi-

Affay BALANCE, a very nice balance used in docimal tical operations, to determine exactly the weights of minute bodies; see fig. 7. This balance should be made of the best steel, and of the hardest kind; because

Balance, that med is not fo eafily spoiled with rust as iron; and it more apt than any other to take perfect polift, shich at the same time prevents the rult.

The firucture of the affayer's scale is little different fom that of common scales, otherwise than by its nicety and smallness. The longer the beam of it is, the more exact may the weight of a body be found; however, 10 or 12 inches are fufficient length. Let the thickness of it be so little, that two drachms may hardly be hung at either of its extremities without its bending; for the largest weight put upon it seldom exceeds one drachm. The whole surface of this beam must be altogether without ornaments, which only increase the weight and gather dust, &c. The beam is inspended in a fork, the two legs of which are steel fprings joined at top, but kept together below with a brats pliant class, parallel, and two lines and a half diflant from each other. This class being taken off, and the legs of the fork being ftretched out, the axis of the beam may be put into two holes made for that putpose at the end of the legs, or be taken away from them. Let a very sharp needle be fixed in the head of the fork, ilanding perpendicularly downwards, if the fork is suspended, and so long, as that it may almost touch the top of the tongue of the beam put into the tork when in equilibrio. This needle is the mark of the equilibrium; and that the artists may be able to obtaive this, the legs of the fork must be broader in that place, and have an opening two or three lines wide; this fork may be adorned at pleafure, provided the motion of the balance is not hindered by fuch ornaments: then take two scales made of thin plate of silver, one inch and a half in diameter, hanging on three small silk flyings, almost as long as the beam, tied together at top, with a filver hook in form of an S, and hang them to the extremities of the beam :- a smaller dish or blued fleel, somewhat less than one inch in diameter, belongs to each of these scales. You first put into these dishes, with a pair of pincers, the bodies to be weighted, or with a spoon or a small shovel, when they are pounded, and then you put them into the fcules; therefore the small dishes must be perfectly equal in weight. We use them, that bodies may be more conveniently put into and taken out of the scales, and that these which are vailly thin may not be bent or foiled, and thence rendered falle by wiping.

This balance is fulpended on a moveable brais or copper support, which confilts of a pedestal, and of a column fet upon it about 20 inches high, at the top of which comes out at right angles an arm one inch long. At the extremity of this arm, put a small pulley three lines in diameter, mother at the top of the column, and a third near the bottom of it; all which pulleys must turn very easily on their axes. At the diflance of one inch and a half below the upper arm, let another arm one inch and a half long come out of the column at right angles, having a hole through it two lines long, a quarter of a line broad, and placed perpendicularly below the pulley of the upper arm, to receive a small plate, one inch and a half long; and of fuch breadth and thickness, as that it may freely move up and down, and yet not have too much play within the hole. This plate must also have a small hook at each extremity.

And as suches balance will hardly sland still in the

open air, and becomes false when spoiled with duff, Balance, it must be put, together with its support, into a fmall case as represented in fig. 7. having glasses, a, a, a, at top, and all round it, that you may fee what is within.

Manner of using the Affey-BALANCE.-Pals a filk ftring over the three pulleys of the support, and tie it at its upper extremity to the small hook introduced into the hole of the inferior arm; then put the support in the middle of the small case, and pass the other extremity of the filk firing below, through a hole bored in the middle of the lower part of the frame, containing the window in the fore part of the case, and falten it to a finall weight of a cubic form. Suspend the fork of the balance on the inferior hook of the plate. By this means if you move backwards and forwards the weight fallened to the string, placed upon the top of the drawer jutting out beyond the fore part of the case, the balance within is either listed up or let down. But you must put the bodies to be weighed, and the weights thenselves, into the small silver diffes; and thefe, when loaded, into the scales thro' the fide windows, which must be opened for that purpole. When any thing is to be added to or taken out of them, you do it with the finall pincers; or, if it is powder, with the fmall thovel or fpoon : but you must let the balance down every time any thing is to be added or taken away, that the leales may reft upon the bottom of the case; and that the windows before the balance is lifted up again, especially if the air is not perfectly calm.

Hydroflatic BALANCE, an inferement contrived to determine accurately the specific gravity of both solid and fluid bodies. It is confirmated in various forms; but we shall content ourselves here with describing that which appears of all others the most accurate.

VCG (fig. 5.) is the fland or pillar of this hydrostatic balance, which is to be fixed in a table. From the top A hangs, by two filk ftrings, the horizontal bar B B, from which it is suspended by a ring i, the fine beam of a balance b; which is prevented from defeeding too low on either fide by the gently springing piece t n y z, fixed on the support M. The harness is annulated, at o, to show diffinelly the perpendicular polition of the examen, by the imall pointed index fixed above it.

The strings by which the balance is suspended, pasfing over two pulleys, one on each lide the piece at A, go down to the bottom on the other lide, and are hang over the hook at e; which hook, by means of a forew P. is moveable about one inch and a guarter, backward and forward, and therefore the balance may be raifed or depressed so much. But if a greater elevation or depression be required, the sliding piece S, which carries the fcrew P, is readily moved to any part of the square brass rod VK, and fixed by means of a fcrew.

The motion of the balance being thus adjusted, the refl of the apparatus is as follows: HH is a small board, fixed upon the piece D, under the scales d and e, and is moveable up and down in a low flit in the pillar above C, and fastened at any part by a screw behind. From the point in the middle of the bottom of each scale hangs, by a fine hook, a brass wire a d and ac. These pass through two holes mm in the

Balance, table. To the wire a d is suspended a curious cylindric wire rs, perforated at each end for that purpose: this wire rs is covered with paper, graduated by equal divitions, and is about five inches long,

> In the corner of the board at E, is fixed a brafs tube, on which a round wire b1 is fo adapted as to mowe neither too tight nor too free, by its flat head I. Upon the lower part of this moves another tube Q. which has fufficient friction to make it remain is any position required: to this is fixed an index T, moving horizontally when the wire Al is turned about, and therefore may be eafily fet to the graduated wire rs. To the lower end of the wire rs hangs a weight L; and to that a wire pn, with a small brass ball g about one fourth of an inch diameter. On the other fide, to the wire a c, hange a large glass bubble R, by a horse hair.

> Let us first suppose the weight L taken away, and the wire pn suspended from S: and, on the other fide, let the bubble R be taken away, and the weight F, fuspended at c, in its room. This weight F we suppose to be sufficient to keep the several parts hanging to the other scale in equilibrium; at the same time that the middle point of the wire pn is at the furface of the water in the veffel N. The wire pa is to be of fuch a fize, that the length of one meh shall weigh four grains.

> Now it is evident, fince brafs is eight times heavier than water, that for every inch the wire finks in the water it will become half a grain lighter, and half a grain heavier for every meh it rifes out of the water: consequently, by finking two inches below the middle point, or rifing two inches above it, the wire will become one grain lighter or heavier. Therefore, if, when the middle point is at the furface of the water in equilibrium, the index T be let to the middle point a of the graduated wire rs, and the diffance on each fide ar and as contains too equal parts: then, if in weighing bodies the weight is required to the hundreth part of a grain, it may be easily had by proceeding in the following manner:

> Let the body to be weighed be placed in the scale d. Put the weight X in the scale e; and let this be fo determined, that one grain more shall be too much, and one grain left too little. Then the balance being moved gently up or down, by the forew P, till the equilibrium be nicely flown at o, if the index T be at the middle point a of the wire rs, it shows that the weights put into the scale e are just equal to the weight of the body. By this method we find the absolute weight of the body; the relative weight is found by weighing it hydrostatically in water, as

> Instead of putting the body into the scale e, as before, let it hang with the weight F, at the hook c, by a horse hair, as at R, supposing the vessel O of water were away. The equilibrium being then made, the index T standing between a and r, at the 36 divi-sion, shows the weight of the body put in to be 1095,36 grains. As it thus hangs, let it be immersed in the water of the vessel O, and it will become much lighter: the scale e will descend till the beam of the balance rest on the support z. Then suppose 100 grains put into the scale d restore the equilibrium precifely, so that the index T stand at the 36 divi

fion above a; it is evident that the weight of an Balance equal bulk of water would, in this case, be exactly 100

After a like manner this balance may be applied to find the specific gravity of liquids, as is easy to conceive from what has been faid.

BALANCE of Trade. That which is commonly meant by the balance of trade, is the equal importing of foreign commodities with the exporting of the native. And it is reckeped that nation has the advantage in the balance of trade, which exports more of the native commodities, and imports less of the foreign. The reason of this is, that, if the native commodities be of a greater value than are exported, the balance of that account must be made up in bullion or money; and the nation grows is much richer, as the balance of that account amounts to.

BALANCE of a Clock, or Watch, is that part which regulates the beats. See CLOCK-Making.

BALANCE-Fifb. See SQUALUS.

BALANCER, in the history of infects, a ftyle, or oblong body, ending in a protuberance or head, found under each wing of the two-winged flies; these serve to poife the body of the fly.

BALANCING, among feamen, the contracting a fail into a narrower compats, in a storm, by retrenching, or folding up a part of it at one corner : this method is used in contradistinction to reesing, which is common to all the principal fails; whereas balancing is peculiar to few, such as the mizen of a ship, and the main fail of those vestels wherein it is extended by a boom. See Boom and REEF.—The balance of the mizen is thus performed: the mizen yard is lowered a little, then a small portion of the fail is rolled up at the peck or upper corner, and faltened to the yard about one-lifth inward from the outer end or yard-arm toward the mast. See Mizen .- A boom main-fail is balanced, after all its reefs are taken in, by rolling up a fimilar portion of the hindmost or aftmost lower corner called the clue, and fastening it strongly to the boom, having previously wrapped a piece of old canvals round the part (which is done in both cafes) to prevent the fail from being fretted by the cord which fastens it.

BALANUS, in zoology, the trivial name of a fpecies of lepas. See LEPAS.

BALASTINES, in botany. See Punica.

BALAYAN, a province of the island of Manilla in the East Indies, belonging to the Spaniards .- It lies next to the city of Manilla, and extends along the coast on the east side of the island, a little beyond the bay of Batangas. There were formerly gold mines in it, but they have been long fince abandoned. It is inbabited by about 2500 tributary Indians, and abounds in cotton, rice, and palm trees. The province is well cultivated; and the Spaniards, generally speaking, have country houses in it.

BALBASTRO, an episcopal town of Spain, in the kingdom of Arragon, and capital of a diffrict of the fame name. E. Long. o. 20. N. Lat. 41. 50.

BALBEC, a city of Afia in Syria, anciently called Heliopolis, and by the Arabians The wander of Syria. It is fituated at the foot of Anti-Lebanon, precifely on the last rifing ground where the mountain terminates in the plain. As we arrive from the fouth we discover,

Balbec.

Balbes. discover the city only at the distance of a league and a half, behind a hedge of trees, over the verdant tops of which appears a white edging of domes and minarets. After an hour's journey we reach these trees, which are very fine walnuts; and foon after, crofting fome ill cultivated gardens, by winding paths, arrive at the entrance of the city. We there perceive a ruined wall, flanked with square towers, which ascends the declivity to the right, and traces the precincts of the ancient city. This wall, which is only ten or twelve feet high, permits us to have a view of those void fpaces and heaps of ruins which me the invariable appendage of every Turkift city; but what principally attracts our attention is a large etifice on the left. which, by its lofty wall and rich collimns, manifeltly appears to be one at those temples which antiquity has left for our admiration. These ruins, which are fome of the roll beautiful and best preserved of any in Afia, mait a particular defoription,

To se a just idea of them, we must suppose ourfolion descending from the interior of the town. Afher having croffed the rubbith and huts with which it is filled, we arrive at a vacant place which appears to have been a fquare; there, in front, towards the well, we perceive a grand ruin, which confifts of two pavilions ornamented with pilatters, joined at their hottom angle by a wall 160 feet in length. This front commands the open country from a fort of terrace, on the edge of which we diffinguish with difficulty the bases of twelve columns, which formerly extended from one pavilion to the other, and formed &. portico. The principal gate is obstructed by heaps of stones; but, that obstacle surmounted, we enter an empty space, which is an hexagonal court of 180 feet diameter. This court is strewed with broken columan, mutilated capitals, and the remains of pilasters, entablatures, and cornices; around it is a row of runed edifices, which display all the ornaments of the nichest architecture. At the end of this court, oppolite the well, is an outlet, which formerly was a gate, through which we perceive a fill more extensive range of rums, whose magnificence strongly excites curiofity. To have a full prospect of these, we must ascend a flope, up which were the fleps to this gate; and we then arrive at the entrance of a square court, much more spacious than the former, being 350 feet wide and 336 in length. The eye is first attracted by the end of this court, where fix enormous and majeffle columns render the scene aftonishingly grand and picturefque. Another object not less interesting is a fecond range of columns to the left, which appear to have been part of the periffyle of a temple; but before we pals thither, we cannot refule particular attention to the edifices which enclose this court on each side, They form a fort of gallery which contains various chambers, seven of which may be reckoned in each of the principal wings, viz. two in a femicircle and five in an oblong square. The bottom of these apartments still retains pediments of niches and tabernacles, the supporters of which are 'destroyed." On the side of the court they are open, and prefeut only four and fix columns totally destroyed. It is not easy to conceive the use of these apartments; but this does not diminish our admiration at the beauty of their pilasters and it ichness of the frize of the entablature.

Neither is it pessible to avoid remarking the fingular Balbec. effect which results from the mixture of the garlands, the large foliage of the capitals, and the foulpture of wild plants with which they are everywhere ornamented. In travering the length of the court we find in the middle a little fquare esplanade, where was a pavilion, of which nothing remains but the foundation. At length we arrive at the foot of the fix columns; and then first conceive all the boldness of their elevation and the richness of their workmanthip. Their shafts are 21 feet eight inches in circumference and 58 high; so that the total height, including the entablature, is from 71 to 72 feet. The fight of this fuperb rain, thus folitary and unaccompanied, at first strikes us with astonishment; but, on a more attentive examination, we discover a feries of foundations which mark an oblong square of 268 feet in length and 146 wide; and which, it feems probabie, was the periflyle of a grand temple, the primary propose of this whole structure. It presented to the great court, that is to the cast, a front of ten columns, with to on each fide, which with the other fix make in all "14. The ground on which it flood was an oblood funce, on a level with this court, but narrower than 14. To that there was only a terrace of 27 feet wide room the colonisade; the explanade this produces from the colonisade; the explanade this by a floping wall the colonisade; the explanade the west, by a floping wall the country towards the west, by a floping wall the country towards the facent, as you approach the tax the foundation of the colonisate less steep, so that the foundation of the partition is on a level with the termination of the hill; whence it is evident that the whole ground of the dourts has been artificially raifed. Such was the former flate of this edifice; but the fouthern fide of the grand temple was afterwards blocked up to build a maller one, the peri-five and walls of which see full remaining. This temple, fittisted fomewant lower than the other, prefrom a fide of 13 columns by eight in from (in all 34), which are likewife of the Cornelius wides their thates are 13 feet eight inches in promise forence, and 44 in height. The building they funding is an obling fquare, the front of which turned towards the call, is not of the line of the belowing of the great court. To reach it you must cross withke of columns, heave of finne, and a rumous wall by which it is now hid. After surmounting these obstacles you arrive at the gate, where you may furwey the enclosure which was once the habitation of a god; but inflead of the swful feene of a profeste people and facrifices offered by a multitude of pricing the fley, which is open from the falling in of the most only lets in light to flow a chaos of ruins cuvered with dust and weeds. The walls, formerly eariched with all the ornaments of the Corinthian order, now present nothing but pediments of niches and tabernacles, of which almost all the supporters are fallen to the ground. Between these niches is a range of fluted pilatters, whole capitals support a broken entablature; but what remains of it displays a rich frize of foliage refling on the heads of fatyrs, horfes, bulls, &c. Over this entablature was the ancient roof, which was 57 feet wide and 110 in length. The walls which supported it are 31 feet high, and without a window. 'It is impossible to form any idea of the ornaments of this roof, except from the fragments lying on the ground; but it could not have been

Ballier. richer than the gallery of the periffyle : the principal remaining parts contain tablets in the form of lozenges, on which are represented Jupiter seated on his eagle; Leda careffed by the fwan; Diana with her bow and crescent; and several busts which seem to be figures of emperors and empresses. It would lead us too far to enter more minutely into the description of this aftonishing edifice. The lovers of the arts will find it described with the greatest truth and accuracy in a work published at London in 1757, under the title of Ruins of Balbec. This work, compiled by Mr Robert Wood, the world owes to the attention and liberality of Mr Dawkins, who in 1751 vifited Balbec and Palmyra. But several changes, however, have taken place fince their journey; for example, they found nine large columns standing, and in 1784 Mr. Volney found but fix. They reckoned 29 at the leffer temple, but there now remain but so: the others have been overthrown by the carthquake of 1750. It has likewife to thaken the walls of the leffer temple, that the ftone of the foffit, or crofs done at the tap of the gate, has flid between the two adjoining ones, and descended eight inches; by which means the body of the bird foulptured on that flore is suspended, detached from its wings and the two garlands which hung from its beak, and terminated in two genu. Mature alone has not effected this devastation; the Turks have had their there in the defination of the columns. Their motive is to procure the iron summet, which ferve to ioin the feveral blooks of which each column is compoled. Thele cramps solver to well the end intended, that deveral of the columns are not even disjointed by their fail; one, among athers, as Mr Wood obferres, has penstrated a flone of the temple wall without giving way. Nothing confurpate the workmanship of these columns a slaw are joined without any cement, yet there is not more for the blade of a knife between their interflices. After to many ages, they in geneval still retain their original whiteness. But what is full more afficiently, is the enermous flones which compole the flowing wall. To the well the second layer it formed of flones which are from 28 to 35 feet long, by about nine in height. Over this layer, at the north-well angle, there are three floues which slone occupy a space of 1754 feet; viz. the first 66 feet feven maches, the second 38 feet 11, and the third exactly 58 feet; and each of these is 12 feet thick. Thele hones are of a what grante, with large flining fishes like gyple; there is a quarry of this kind of Residenthe whole city and in the adjacent mountain, which is open in feveral places, and among others on the right, as we approach the city. There is full lying there a flone, hewa on three fides, which is 60 Feet two inches long, is feet to inches broad, and feet three in thickness. By what means could the ancients move these enormous masses? This is doubtless a problem in mechanics curious to resolve. The inhabitants of Balbec have a very commodious manner of explaining it, by supposing these editices to have been constructed by Djenoun, or genii, who obeyed the orders of King Solomon; adding, that the motive of fuch immonfe works was to conceal in fullterraneous caverns valt treasures, which still remain there. To discover these, many have descended into the vaults Vol. II. Part 1L

which range under the whole edifice: but the mutility Balbeci & of their refearches, added to the oppressions and extortions of the governors, who have made their fupposed discoveries a pretext, have at length disheartened them; but they imagine the Europeans would be more fuccessful, nor would it be possible to persuade them but that we are possessed of the magic art of destroying talifmaus. It is in vain to oppose reason to ignorance and prejudice: and it would be no less ridiculous to attempt to prove to them that Solomon never was acquainted with the Corinthian order, which was only in use under the Roman emperors. But their tradition on the subject of this prince may suggest three important observations. First, That all tradition relative to high antiquity is as false among the Orientals as the Europeans. With them, as with us, facts which happened 100 years before, when not preserved in writing, are altered, mutilated, or forgotten. To exped information from them with respect to events in the time of David or Alexander, would be as abfurd as to make isquiries of the Flemish pealants concerning Clovis or Charlemagne. Secondly, That throughout Syria, the Mahometans, as well as the Jews and Christians, attribute every great work to Solomon: not that the memory of him full remains by tradition in those countries, but from certain passages in the Old Tellament; which, with the gospel, is the source of almost all their tradition, as these are the only historical books read or known; but as their expounders are very ignorant, their applications of what they are told are generally very remote from truth : by an error of this kind they pretend Balbec is the house of the forest of Lebanon built by Solomon; nor do they approach nearer probability when they attribute to that king the well of Tyre and the buildings of Palmyra. Thirdie, That the belief in hidden treasures has been confirmed by discoveries which have been really made from time to time. It is not many years fince a small coffer was found at Hebron full of gold and filver medals, with an ancient Arabic book on medicine. In the country of the Druses an individual discovered likewise, some time fince, a jar with gold coin in the form of a crefeent; but as the chiefs and governors claim a right to these discoveries, and ruin those who have made them, under present of obliging them to make restoration, those who find any thing endcavour carefully to concoal it; they fecretly melt the antique coins, nay frequently bony them again in the fame place where they found them, from the same fears which caused their first concealment, and which prove the fame tyranny formerly existed in these countries.

When we confider the extraordinary magnificence of the temple of Balbec, we cannot but be aftonished at the filence of the Greek and Roman authors. Mr Wood, who has carefully examined all the ancient wilters, has found no mention of it except in a fragment of John of Antioch, who attributes the confiruction of this edifice to Autoninus Pius. The infcriptions which remain corroborate this opinion, which perfect, ly accounts for the confiant use of the Corinthian on der, since that order was not in general use before the third age of Rome; but we ought by no means to al-lege as an additional proof the hird sculptured over the gate; for if his crooked beak, large claws, and

the cadneeus he bears, give him the appearance of an eagle, the tuft of feathers on his head, like that of ceitain pigeous, proves that he is not the Roman cagle: belides that the fame bird is found in the temple of Palmyra; and is therefore evidently an Oriental eagle, confecrated to the fun, who was the divinity adored in both these temples. His worship existed at Balbec in the most remote antiquity. His slatue, which refembled that of Ofiris; had been transported there from the Heliopolis of Egypt, and the ceremonies with which he was worshipped there have been described by Macrobius, in his curious work entitled Saturnalia. Mr Wood supposes with reason, that the name of Balbec, which in Syriac fignifies City of Bal, or of the fun, originated in this worship. The Greeks, by naming it Heliopolis, have in this inflance only given a literal translation of the oriental word : 'a practice to which they have not always adhered. We are ignorant of the flate of this city in remote antiquity; but it is to be prefumed, that its fituation, on the road from Tyre to Palmyra, gave it some part of the commerce of these opulent capitals. Under the Romans, in the time of Augustus, it is mentioned as a garrison town: and there is still remaining, on the wall of the fouthern gate, on the right, as we enter, an infcription which proves the truth of this, the words KENTURIA PRIMA, in Greek characters, being very legible. One hundred and forty years after, Antoninus built there the present temple, instead of the ancient one, which was doubtless falling into ruins: but Christianity having gained the ascendency under Constantine, the modern temple was neglected, and afterwards converted into a church; a wall of which is now remaining that hid the fanctuary of the idols. It continued thus until the invalion of the Arabs, when it is probable they envied the Christians so beautiful a building. The church being less frequented fell to decay; wars succerded; and it was converted into a place of defence; battlements were built on the wall which furrounded it, on the pavilions and at the angles which fill subfift; and from that time, the temple, exposed to the fate of war, fell rapidly to ruin. The state of the The wretched governcity is not lefs deplorable. ment of the emirs of the house of Harfoushe had already greatly impaired it, and the earthquake of 1750 completed its destruction. The wars of the Emir Youlef and Djezzar have rendered it fill more deferted and rainous. Of 5000 inhabitants, at which number they were estimated in the policy of the policy and all these policy out industry of commerce, and cultivating notes and water melons.

BALBINUS (Decimis Colins), the Roman em-

BALBINUS (Decimits Coclins), the Roman emperor, being chosen by the senate in 237, was massacred by the soldiers, who had a dislike to such emperors as were elected only by the senators. This prince was cloquent, and wrote pretty good verses.

BALBOA (Vafeo Nugnes de), a Caltilian; a celebrated navigator, and one of the first discoverers of South America. He was beheaded by the Spanish governor of St Mary, through jealousy of his growing reputation, in 1517, aged 42.

BALBUS (Lucius Cornelius Theophanes) was born

at Cadiz, and diffinguished himself by his valour in the war carried on by the Romans in Spain against Sertorius and the Lustianians, on which account Pompey gave him the privileges of a Roman citizen. He was consul in the 714th year of Rome, and was the first foreigner on whom that dignity was conferred. He was the friend of Pompey, Cæsar, Crassus, and Cicero.—There were many other illustrious Romans of the name of Balbus.

BALCONY, in architecture, a projecture in the front of a house, or other building, supported by pillars or consoles, and encompassed with a balustrade.

BALDACHIN, or BALDAQUIN, in architecture, a building in form of a canopy, supported by pillars, and frequently used as a covering to insulated altars. Some also use the term baldachin for the shell over a door.

BALDINACCI (Philip), of Florence; a connoisfeur in the polite arts, and the continuator of Vasari's lives of the painters. He died in 1696, aged 72.

BALDIVIA, or VALDIVIA, a fea-port town of Chili, In America, belonging to the Spaniards. It is fituated between the rivers Callaculles and Portera, where they fall into the South fea. W. Long. 80. 5: S. Lat. 40. 5 Vic was built in 1551 by the Spanish general Baldivini from whom it takes its name. We may judge of its importance from the fum granted annually by the king for maintaining the garrifon and keeping the fortelientions in repair, being no less than 300,000 pieces of eight. It is defended by four flrong caltles, mounting 100 pieces of time brafs cannon. Notwithstanding which, however, as the garrison is composed mostly of transported priminals, on whom no dependence can be placed, and generally ill supplied with ammunition, &c. it could make but a poor defence. In 1643 it was cafily taken by the Dutch, who would probably have maintained their conquest against all the power of the Spanish viceroy, had they not been obliged to relinquish it through sickness and famine. The inhabitants of Baldivia amount to about 2000. The trade is left confiderable than formerly, because the gold mines in the neighbourhood are that up a yer feveral large thips are employed in the trade between this port and that of Lima, which coulits of gold, corn, hides and falt provisions, which are exchanged for flaves, Ingar, checolate, and European commodities and mapuractures.

BALDNESS, a defect of hair, chiefly on the finciput. It differs from eleperia, area, ophiafis; and rinea. an these all write from some vice in the nutritions humour; baldness, from the desect of it. When the eyelide thed their bair, it is called a ptilofis. Among the causes of baldness, immoderate venery is reputed one of the chief; old age usually brings it on of courfe. Some will have the proximate cause of baldness to be the dryness of the brain, and its thrinking from the cranium; it having been observed, that in bald persons there is always a vacuity or empty space between the skull and the brain .- Calvus, bald-pate; was a frequent term of reproach among the Romans; among whom this defect was in great discredit. Hence divers arts to conceal it, as false hair, a galericulus contrived on purpose. The later Romans, however, seem to have been . reconciled Baldoe Bale. reconciled to baldness; for we find among them a kind of officers, or fervants, called glab atores or glabrarii, whose business was to take off the hair from all parts, even from the head. In an ancient inscription, there is mention of one Diophantus. TI. CAESARIS ORNATOR GLABR. that is, Ornator Glabrarius.

. BALDOC, a town of Hertfordshire, in England, chiefly noted for its trade in malt. W. Long. 0. 10.

N. 1 at. 51. 55.

BALDOCK (Ralph de), bishop of London in the reigns of Edward I. and II. was educated at Merton college, in Oxford; became dean of St Paul's; was afterwards promoted to the see of London; and at last was made lord high chancellor of England. He had a very amiable character both for morals and learning; and wrote Historia Anglica, or a History of the British Assaures and Constitutions of the church of St Paul. Bishop Baldock died at Stepney, July 24, 1313.

BALDWIN, archbishop of Canterbury, was born of obscure parents at Exeter, where, in the early part of his life, he taught a grammar school ; after which he took orders, and was made archdeacon of Exeter; but he refigned that dignity, and became a Ciffertian monk in the monastery of Ford in Devoushire, of which in a few years he was made abbot. In the year 1180, he was confecrated bilaop of Wordstor. In 1184, he was promoted to the see of Canterbury by Pope Lucius III. and by his successor Artist III. was appointed legate for that dioceler. He laid the foundation of a church and monastery in honour of Thomas Becket, at Hackingson, near Canterbury, for fecular priests; but, being opposed by the monks of Canterbury and the pope, was obliged to defilt. In 1100 he crowned King Richard I. at Westminster; and soon after followed that prince to the holy land, where he died at the slege of Ptolemais. Giraldus Cambrensis, who accompanied him in this expedition; fays; he was of a mild disposition, and of great abilisence. He wrote various tracts on religious subjects, which were collected and published by Bertrand Tiffier in 1662.

BALE (John), bishop of Offory in Ireland, was born at Cover mear Dunwich in Suffolk, in the year 1405. At is years of age he was catered in the monastery of Carmelton at Norwich, and was thence fent to Teros college in Oxford. He was educated a Roman Catholic, but was converted to the Protestant religios by Thomas Lord Wentweeth. On the death of Lord Cromwell, farourite of Henry VIII. who proteched him from the perfecutions of the Romin clergy, he was obliged to retire into the Low Countries, where he continued eight years. - Soon after the accession of Edward VI. he was recalled; and being first presented to the living of Bishop's Stoke in Hampshire, in 1552, he was nominated to the fee of Offory. During his resistence in Ireland he was remarkably assidance in propagating the Protestant doctrines; but to very little purpose, and frequently at the hazard of his life. Once, in particular, they murdered five of his domestics, who were making hay in a meadow near his house; and would probably have done the same by him, if the sovereign of Kilkenny had not come to his affiliance with 100 horse and 300 foot. On the accession of Queen Mary, the tide of opposition became so powerful, that,

to avoid affaffination, he embarked for Holland, but was very unfortunate in his escape. First he was taken by a Dutch man of war, and robbed by the captain of all his effects. Then, being forced by stress of weather into St Ives in Cornwall, he was confined on fuspicion of treason. Being, however, released after a few days confinement, the ship anchored in Dover road, where he was again seized on a salse accusation. After his arrival in Holland, he was kept prisoner for three weeks, and at length obtained his liberty on paying 30l. From Holland he travelled to Basil in Switzerland, where he continued till Queen Elizabeth ascended the throne. After his return to England, he was in 1560 made prebendary of Canterbury, probably not choosing to return to his former flock of wolves. He died in November 1563, at Canterbury, in the 68th year of his age: He was fo fevere a writer against the church of Rome, that his books are particularly prohibited in the expurgatory index published at Madrid, in folio, in the year 1667. He is the earlieft dramatic writer in the English language, or at least author of the first pieces of that kind that we find in print. Of his writings in that way no fewer than 21 have been enumerated; only three of them, however, have been feen in print, viz. 1. God's Promifes, an interlude: 2. St John Baptist, an interlude: 3. Concerning the Laws of Nature corrected; the first of which has been reprinted by Dodsley in the first volume of his collection of old plays, and the only copy extant of the last is preserved in St Sepulchre's library in Dublis, As to the reft, they are mentioned by himfelf as his own, in his account of the writers of Britain before mentioned. He also translated the tragedies of Panimachins. His other works are very numerous; but the chief is his Catalogue of British Authors: a book of forme merit, as it contains fome information which is not elsewhere to be found; but he has destroyed his credit by his intemperate Billingsgate abuse of all those who differed from him in religion. The authentic part of his work is transcribed from Leland. The title of it is, Illustrium Majoris Britannia scriptorum catalogus, à Inpheto fantissimi Noa filio ad an. Dom. 1557.

Bale in commerce. Any goods packed up in cloth,

Bale in commerce. Any goods packed up in cloth, and corded round very tight, in order to keep them from breaking, or preferve them from the weather, is called a bale.—A bale of cotton yarn is from 300 to 400 weight; of raw filk, is from 100 to 400; of lock-ram or daylas, either three, three and a half, or four

pieces.

BALE Goods, among the English merchants, are all such as are imported or exported in bales; but the French give that name to certain hardwares and other force of merchandife which come to Paris, and are commonly made by bad workmen of indifferent materials.

BALEARES 18891.2, or the Balearic Islands. The appellation is commonly derived from Barrer, because the ishabitants were excellent slingers. But Bocham makes the name of Punic or Phochician original, as were the people. Baaljare, a master, or skilful at throwing; the Phochicians and Hebrew's being dexterous at the use of the sling. The Greeks called these islands Gymnesse (Straho); because in summer the inhabitants went naked (Diodorus, Livy), or re-

5 Da Camara

Belowie ther because only armed with a fling in war (Helychius). They are two in number, the Greater and the Lefs, or Major and Minor; and hence the modern names Majorca and Minorca. The Major is distant from the Minor 30 miles to the west, in length 40 miles, and in circuit 150 (Pliny). They were fubdued by Quintus Metellus, thence furnamed Balearicus, in the year 120 B. C. The Baleares, together with the adjacent islands, were a part of the Provincia Citerior or Tarraconculis, and of the refort of the Conventus Carthaginiensis or New Carthage. These illands are called Checarades by Apollomias and Checradades by Strabo, i. c. " rocky." See Majonea and Minonea.

BALEARIC ISLANDS . See the preceding article.

BALECHOU (John Joseph), no very delebrated and well known French engreses flourified about - 1750. He died, according to Bulan, foste few years fince at Avignon. This extraordinary artiff worked. entirely with the graver; and he was perfectly make ther of that inftrument. The clearness of his fireken and the depth of colour which he produced, are far beyond any production prior to his own. The two large plates which he did from Vernet, one reprefenting a florm, the other a calm, must ever be conidered as very attenishing exertions of the artist. They are too well known, and too much admired, to need any further eulogium; and were never equalled until they were perhaps furpassed by our countryman Wool-

BALEN (Henderick Van), history and portraite painter, was born at Antwerp in 1560, and was in disciple of Adam Van Oort; but he quitted that misu's fler to acquire a better taffe of defign and compositions by purlying his fludies at Rome, where he refided for a confiderable time. He copied the antiques; he attended to the works of the most memorable moderne artills; and at his return to his own country, the wifeble improvement of his tafte recommended him to the favour and effect of the ablest judges of the art. 'Ha diffinguished himself by a good manner of deligning, and his works are admitted into the cabinets of the curious among those of the principal painters. He particularly excelled in the naked, and gave to his the gures fo much truth, roundness, and correctness of tustline, that few of his cotemporaries could enter intocompetition with him. Several fine portraits of his hand are at the Hague; among which there is oner adorned with allegorical figures of Wildom and Justicia which extorts commendation from all who attentively confeder it. He died in 1622. All the historical fallsects painted by Van Balen have abundant meritie life. deligns of the Deluge, of Males finishing the Rocks. and the drawning of Rhamoh, are grand and notice compositions. Houbraken observes, that Van Bilen with great judgment, both introduced the Brankwin a clear light in the back ground, but the Higy primbs in a firong fludow in the fore ground, which had a very fine effect; the figures being well defigned, the attitudes and drapaties well chidlen, and the number of the figures heing very confiderable. Of this painter's hand-allo, the Judgment of Paris is accounted a mafterly performance; in which the figure of Venus is to elefee meridiand forth from the furface. The landscapes

and back grounds of the pictures compoled by Van Bains, Bales were generally painted by Velvet Breug- Bales.

BALEN (John Van), painter of history, landscapes, and boys, was born at Antwerp in 1611; and derived his knowledge of the art, and his fine tafte of drawing and defign, from his father Henderick Van Balen ; but as foon as he had made a competent progress, he travelled to Rome, and lived for feveral years in that and other cities of Italy. There he acquired a good gusto of design, though he was sometimes incorrect; and his particular merit was shown in his naked figures of boys, cupids, nymphs bathing or hunting, of which fubicets he painted a confiderable number; and he procured both praise and riches by his laudscapes and histories. His pictures were well handled, his trees touched with spirit, and his herbage and verdure looked natural and lively. The carnations of his figures were clear and fresh; his colouring in general: was transparent; and the airs of his heads were in the

menner of Albano.

-BALES (Peter), a very extraordinary person in his way, and fit to be recorded in a work of this nature. He was a most femous master in the art of penmanship, or fair writing; and one of the first investors (for there feems to have been more than one) of floor-hand: writing. He was born in a sage and is tyled by Authony Wood " a most deuterous parlas in his protein fion, to the great seonder of scholars and others, who adds, that he frant feveral years in sciences. among the Outnians, particularly, as it feams in Gloucefter-half a but that thurty which he used for addisonfine only; proved at length at employment of profit." He is recorded for his hill in merography, or miniature-writings in Hollinsheil's Chambiole, amo 1575 ... and Mr Evelyn also hath celebrated his stenderful skill in this delicate operation of the hand. " bladeian Jumus freaking as a miracle withmubody, who were the Apolitics Creed, and the beginning of St. John's Gob. pel, within the compalated a farthing a what would be have laid," lays Mr. Evelyn, " of per female. Retre. Bulse; who, in the year 1975, mosts the Lord's Brayor, the Grand, Decalogue, such two thort prayers Latin, his own name, motto, day of the month, your of the Lord and reign of the samen; to whom he proforted it at Hampton Court, all of its written within the circle of a lingle ristory, eachafed, in a ring and herders of golds with squerett such a creful to see. curately wrought; so to his very plainly legible, to the grout admiration of her majority the whole prive comefasther very dartiesus, in amirating hand, writing, and about 1586; was employed by Secretary Wallingham in ocrasis political manourses. We find, him at the hand of a fehool, near the Old Builey, London, int 1590; in in which year he published his " Writing: Schoolmafter, is three parts a blue first teaching swift. writing; the fecond/time writing; the third, fair writing." In 1595, he had a great trial of fluit in the Black-friers with one Daniel Johnson, for a golden pane of 201. value, and won it; and a contemporary author: farther relates, that he had also the arms of Caligraphy given him, which are Azure, a Pen, Or, as a prize, at a trial of skill in this art among the best penmen in: London. In 1597, he republished his ". Writing: Schoolmaster;

Belefire, Schoolmester;" which was in such high reputation, that no less than eighteen copies of commendatory verses, composed by learned and ingenious men of that time, were printed before it. Wood fays, that he was engaged in Effex's treasons in 1600; but Wood was mistaken: he was only engaged, and very innocently for in ferving the treacherous purpoles of one of that earl's mercenary dependants. We know little more of this curious person, but that he seems to have died about the year 1610.

BALESTRA (Antonio), an excellent historical painter, was born at Verona in 1666. At the age of 21 he went to Venice, where he entered himself in the School of Antonio Belluci, and continued for three years under his direction; but from thence he visited Bologna and Rome, and at the latter became the difciple of Carlo Maratti. Under the tuition of foreminent a genius, he made a very great proficiency, and exerted himfelf for fome hours of each day in defigs ing after the antiques, after Raphael, Corregio, Hannibal Carracci, and other admired painters by which conduct he to effectually confirmed his talks and freedom of hand, that he obtained the prize of ment in the Academy of St Luke, in the year a 6944 when he was only 28 years of age. From that time; his reputation was established, and he received fusicient encouragement; being engaged to week for most of the churches, and in the palaces of the nobility, and his paintings were admired in every part of Europe. litis flyle is fwees and agreeable, not unlike that of Maratti; and the judicious observe in the works of Baleftra, accortain mixture of the leveral manners of Raphacty Corregios and Carrage. He died in 1740. In the church of Santa Maria Mater Domini at Vonice, there is one of the most capital performances of Balefler, representing the instituty of our Saviour. It is defigured in a grandification the composition is excellent, and has a great dest of graine. The heads are protematicalde bearings. . In a chapel belonging to the church of A. Cominimo, in the fame kitty, there is a dead Christian the arms of the Virgin, painted by this neafter in aggrand tafte; and although the composition consider that of a few figures, they are facily deligned, and in every part of it there is sufficient merit to chief

and justify appleuse to the for of Heavy Dulcysof Warswell in Dorferfiere, was howent Butthen in the fame county, and educated at Winchester Schools River thence he was less to Onford y and, after now years production, was admitted perpetuil follow of New Col-lege in the year 1930. Islaning taken his degrees in arre, he practifed physic, and in 1338 was practice of the university. About this time he obtained a meetband of Wells, which he refigned in 1570. In the year 1961 he was appointed queen's profesior of phyin 1963 proceeded doctor in that faculty, and aft. terwards became one of her majeky!s phylicians in ordensey. He was thought finiful in his profession, and had confiderable practices! He died in 1 992; aged 67; and was buried in the inner chapel of New College. His: workware, 1. Aidiscourse of three hindr of pepper in common use, 1586, 8vo. 2. Brief treatife of the preservation of the eye-figle; first printed in the reign of Elinabeth, in 12500; afterwards at Oxford in 1616 andi 1654, 8vo. 3. Directions for health, natural and and Ball tificial; with medicines for all difeafer of the eyes, 1626, Balloon 4to. 4. Emplicatio Galeni de potu convalescentium et senum, &c. manuscript, formerly in Lord Aylesbury's.

BALI, an island of Asia, in the East Indies, forming the north fide of the ftrait: of Java, through which the East India ships sometimes return from China to Europe: but the passage is commonly difficult on account of contrary winds. The island is extremely populous, and abounds in rice and other productions proper to the climate. The inhabitants are Pagans, and very warlike. E. Long say, gas S. Lat. 9. o.

BALIOL, or Ballion, (Sir John de), founder of Baliol college in Oxford, was the fon of Hugh Baliol, of Bernard's calife, in the diocele of Durham; and was a person very emisent for his power and riches. During the contains and wart between King Henry III. and his become, he firmly adhered to the king. In 1263, in hegen the foundation and endowment of Baliol colloge, which was afterwards perfected by his widow .. He died in the year 1269.

BALLOL, BALLIOL, or BOTLLIOL, (John), the brother of Alexander king of Scotland, and competitor with Robert Bruce for that crown. See SCOTLAND.

BALISORE, a sea-port town of Asia, in the East Indies, to the north-west of the bay of Bengal. It is about four miles from the fea by land, but 20 by the river; feated in a very fruitful foil, producing rice, wheat, aromatic feeds, tobacco. Sc. The inhabitants wheat, aromatic feeds, tobacco. &c. make feveral forts of stuffs of cotton, filk, and a kind of grafe. The English, French, and Dutch, have factories here; but they are now of no great account .. Ec Long. 85. 20. N. Lat. 21- 30.

BALISTES, in ichthyology, a genus of fishes belonging to the order of amphibia nantes. The characters are these: The head is flat; there are eight teeth in each fide, and the two anterior once are longest; in the place of gills, the balifles has no aperture immedistrely above the pectoral fins; the body is flat, the fcales are joined together by the skin, and the belly is The species of this genus are eight; viz. keeled. 1. The monoceros, whose head fin confilts of but one ray, and the tail rays are carinated. It is called the unicers fift by Catelly; who informs us that the guts of this fill are full of small shells and coralline substances, which by the strength and hardness of its jawa it is consided to grind very fmail. Thefe fith, he side are not ago, being accounted poisonous. They frequent those less, amongst the Babama islands, white the counterers in greatest plenty. 2. The hispidass whate west in in miradiated; and there is a round birok foot in the sail fat. The body is rough and beilly tounds the tail. The fpine or horn fituated butween the eyes; the faque is futulated; and sattendof a helly his it has a jagged therp spine. This species is a maire of Carolina. 3: The comentoles, whose head in is biredimed, and the body of it towards the hind-part is hairys Isia a native of America. A The pepillofus, has a biridiared brok fin, and a papillous body. g. The vereneous; have griradiated bank fin; and the tail in full of little warth. In the place of a belly fin, this species has a large, thick warry ray. It has 25 small reversed sharp spineaut the fide of the tail, . dispulsed in the rown letter make afteria. 6. The:

Milivo, aculentus has a triradiated back fin; and the spines of the tail lean upon each other. It is also a native of India. 7. The vetula, or old wife, has a triradiated back fin; the belly fin is longitudinal, and fomewhat carmated; and the tail fin is forked. It is found at Afcention illand. 8. The ringens, has a trivadiated back fin; there are three folds on each fide of the head, and the tail fin is forked. This species is likewise found at Afcention illand.

> BALIVO AMOVENDO, in law, was a writ for removing a bailist from his office, for want of having sufficient land in his bailiwick to answer the king and his people, according to the flatute of Westminster, 2 reg. Orig. 78.

> BALK, among builders, is fornetimes used for the fummer beam of a house; sometimes for the poles and rafters which support the inofacof barns, &c.; and formetimes for the beams used in making sea holds.

> BALK, or Bulkh, a province of Great Bukharia in Alia, about 360 miles long and 250 broad, fituated to the fouth of the province of Samarkand, and to the cail of Bukharia Proper. It is the least of the three provinces that make up what is called Great Bukharia; but being extremely fertile and well cultivated, the prince draws a great revenue from it. The country particularly abounds with filk, of which the inhabitants make pretty manufactures. The Uzbecks subject to the khan of Balkh are the most civilized of all the Tartars inhabiting Great Bukharia, owing probably to their commerce with the Perfians: they are likewife more industrious, and more honest, than the rest: but in other respects have the same customs with the rel of the Tartars. The province is subdivided into feveral counties; the most remarkable of which are Khotlag or Katlan, Tokharefian, and Badagfhan. Its chief cities are Balk, Fariyab, Talkhan, Badagshan, and Anderab.

> BALK, the capital of the above-mentioned province, fituated on the frontiers of Perha, in E. Long. 65. 26. N. Lat. 37. o. It is probably the ancient Bactra, capital of the kingdom of Bactria; and is faid by the Perfians to have been founded by Kay-umarras the find king of Perha, because he met his brother upon the spot where it flood after he had been loft for a long time; balkbiden, or balgbiden, in the Perfic language, figurfying to receive and embrace a friend. The first kings of Persia who resided in the province of Media or Aderbijan, confidered this city as one of their principal frontiers on the fide of Scythia. In the 27th year of the Hegira, of Christ 647, Balk was reduced by the Arabs, under the command of Abdilla lah Ebn Amer. It continued subject to Arab princes till the year of the Hegira 432, of Christ 1041 Author it was reduced by Togrol Beg. the Tangrolipis of the Greeks, and prince of the Seljukian dynally. It was taken by Jenghiz Khan, A. D. 1221, who with his usual and unparalleled crucky caused all the inhabitants to be brought without the walls and maffacred without mercy. In 1369, Sultan Holein, the last of the tree of Jonghiz Khan, was driven from Balk by Par mane, whose successors were driven out by the Uzbecks in the 15th century. It was afterwards redecord by Shah Ilmael Sun; but finally wrested out Charles by the Uzbeck Tartars, between whom Porlians it is the occasion of almost continual

wars. It was not long fince the refidence of a khan Balkets of Tartars. It is the most considerable city possessed in these parts by the Mahometan Tartars, is large, well built, and populous, the houses confisting for the most part of stone or brick. The fortifications confist of bulwarks of earth, fenced without with a strong wall, high enough to cover the foldiers employed in defence of those fortifications. As this place is the refort of all the bufiness transacted between the Indies and Great Bukharia, trade flourishes extremely at Balk; especially as it has a fine river passing through its fuburbs, which is of vast service to the town. This river falls into the Amu, in N. Lat. 38. 30. upon the confines of Great Bukharia and Kowarazm. The khan's palace, or caftle, is a large edifice built after the oriental manner; and confitts almost entirely of marble, of which there are fine quarries in the neighbourhood. The khan of Balk, however, was obliged in 1730 to submit to the Persians under Khouli Kan . but fince that time has most probably regained his independency.

BALKERS, in the fishery, persons placed on rocks and eminences at fea to fpy the herring droves, and give notice to the fishermen, by waving boughs, what way they go, and where they may be found.

BALL, in a general fense, a spherical and round body, whether paturally los or formed into that figure by art.

BALL, in the military art, comprehends all forts of bullets for fire arms, from the cannon to the piltol. Caunon balls are of iron ; musket balls, piftol balls, &c. are of lead. The experiment has been tried of ipon balls for pillols and faloes ; but they are jufly rejected, not only on secount of their lightness, which prevents them from flying flraight, but because they are apt to furrow the barrel of the pittol, ecc.

Batt of a Pendulum, the weight at the bottom. " In thorter pendulums this is called the bed.

... Ball, in pyrotechnics, is also a composition of various combustible ingredients, ferving to burn, fincke, give light, &c. In this fense we read of fire balls. light balls, fmoke balls, flink balls, fky balls, wester balls, land balls.

BALL, among the Cornish miners, fignifies a tin Ball, among printers, a kind of wooden tunnel.

stuffed with wool, contained in a leather cover, which is sailed to the wood, with which the ink is applied on the forms to be wrought off. See PRINTING.

Horfe-Balls, among farriers. Horfes have a very nice take; it is therefore proper to give the more difspecialle drugs in the form of balls, and to make drenches of the more palatable. Balls should be of an eval shape, not exceeding the fize of a pullet's eggs and should be dipped in sweet oil to make them slip down the easier. Some horses have a strait gullet, which makes them very averse to a ball being thrust down their throats; such horses had better have: drenches given them, or their medicines may be mixed with bran, or in their mathes. See FARRIERY, passim.

Ball Vein, in mineralogy, a name given by the miners of Suffex to a fort of iron ore common there, and wrought to confiderable advantage. It yields not . any great quantity of metal, but what it has runs freely, in the fire; it is usually found in loose masses, not in the form of a stratum, and is often covered with one or more crusts. It generally contains some sparkling particles; and is usually of a circular form in the perfect masses, thickest in the middle, and gradually thinner as it approaches the sides. The ores of Sussex in general are poor, but they require very little trouble in the working; so that a considerable profit is made annually from them.

Ball and Socket is an instrument made of brass, with a perpetual screw, so as to move horizontally, vertically, and obliquely; and is generally used for the managing of surveying and astronomical instruments.

Puff-Ball, the English name of the lycoperdon.

See Lycoperdon. .

Martial Balls, in pharmacy, are a mixture of filings of iron and cream of tartar, formed into a folid confishence and form of a ball, which is used to impregnate water or other liquids with iron diffolved by the tartareous acid. To make these balls, one part of filings of iron and two parts powdered exeam of taxtar are mixed well together, and put into an earthen or iron veffel with fome water. . This mixture is to be flirred from time to time, till it becomes almost dry; and then it is to receive more water, and to be firred as before. This treatment is to be continued till it acquires, when nearly dry formewhat of the confiftence and tenacity of foftened rolling. Then it is to be rolled up in the form of a ball, which is generally kept tied up in a rag; and when intended to be used, it is to. be infused in water, till it gives some colour to that liquids The infusion of married balls is tonic, vulnerary, discutient, and aperitive to and is employed both Sec Iron, internally and externally. " Iron being foluble in all acids, is attacked in this preparation by the tartareous acid, which reduces it to a kind of neutral falt not crystallizable, This fall would remain liquid, and would form a foluble martial tarter, called turtarized tindure of Marse. If proper properties of filings of iron and cream of tartar he used, and treated long enough for an entire and complete combination, nothing would be obtained but a liquor or magma, which could not be preserved in a folid form, but would be continually moils. Therefore, is the martial ball there is a good deal of the oream of tartar and filings of iron not combined together, by which its folidity is preferved.

Misrcurial Bazzs, in pharmacy, are an amalgam of mercury and vin, fufficiently fiffed to be moulded, and to preferve a given form. The method of making them is by adding mercury to method tin, and pouring the fluid mais into a round hollow mould. These balls are employed to purify water, in which they are boiled; for which purpose travellers often carry some along with them. Nothing, however, can be more permicious than such a practice, should the water contain any nitrous acid, which it very often does.

Balls of Silk worms and Spiders, are little cases or cones of filk, wherein these insides deposite their eggs. Spiders are extremely tender of their balls, which they carry about with them, adhering to the papillar about their anus. Grew mentions balls or bags of a species of filk worms in Virginia as big as hers eggs, and containing each four aurelias.

Zoologists speak of a fort of balls of hair covered

over with a fmooth shining coat or shell, found in the stomachs of oxen, cows, calves, horses, sheep, and gold. See the article Bezoar.

BALLS of Fire, in meteorology. See FIRE (Balls

of).

Balls, in electricity, are two pieces of cork, or pith of elder, nicely turned in a lathe to the fize of a small pea, and suspended by fine linen threads; intended as electrometers, and of excellent use to discover small degrees of electricity, to observe the changes of it from positive to negative, and vice versa; and to estimate the force of a shock before the discharge, so that the operator should always be able to tell very nearly before the discharge, by knowing how high he has

charged his jars, what the explosion will be.

Fire BALLS, are bage of canvas filled with gunpowder, fulphur, faltpetre, pitch, &c. to be thrown by the foldiers, or out of mortars, in order to fire houses incommoding trenches, advanced poils, or the like .-The Greeks had divers kinds of fire balls, or Huga Coho. Nilos; one kind called, more particularly, oxulaxia, or made of wood, fometimes a lost or ever a cubit long; their heads being armed with fpikes of iron, beneath which were hemp, pitch, and other combustibles, which being set on sic, they were cast among the enemy. The preparations of fire balls, among the moderns, confift of feveral operations, viz. making the bag, preparing the composition, tying, and, laftly, dipping the ball. 1. The bags for the purpose are either oval or round. 2. The composition wherewith fire balls are filled is various: To ten pounds of meal gunpowder add two of faltpetic, one of fulphur, and one of colophony; or to fix pounds of gunpowder, add four of faltpetre, four of fulphur, one of powdered glass, half a pound of antimony, as much camphor, an ounce of fal ammoniae, and four of common falt, all pulverized. Sometimes they even fill fire balls with hand grenades. 3. For tying the fire balls, they prepare two iron rings, one fitted found the aperture, where the ball is to be lighted, the other near its base. A cord is tied to these rings in such a manner, as that the feveral turns reprefent femicircles of the sphere cutting the globe through the poles: over the cords, extended according to the length of the ball, others are tied, cutting the former at right angles, and pavallel to each other, making a knot at each interfection: laftly, after putting in a leaden bullet, the rest of the space is filled with tow or paper. 4. Thus completed, the fire ball remains to be dipped in a composition of melted pitch four pounds, colophony two, and linked of broil of turpentine two; after dipping, they cover pround with tow, and dip again, till it be brought to the just diameter required.

Light Balls, are such as diffuse an intense light around; or they are halls which, being cast out of the hand or a mortar, burn for some time, and illuminate the adjacent parts. 1. Luminous or light balls for the hand are, made of ground powder, sattpetre, brinstope, camphor, and borax, all sprinkled with oil, and moulded into a mass with suct; and this is wrapped up in tow, with a sheet of strong paper over it. To fire it, they make a hole into it with a bodkin, into which they put some priming that will burn flow, Its use is to be cast into any works they would discover in the night time. 2, For the larger light balls, or

thole

the to be thrown to a greater distance, they melt equal quantities of sulphur, turpentine, and pitch; and herein dip an earthen or stone ball, of a diameter much less than that of the mortar out of which the fire ball is to be cast: then rolling it in gunpowder, and covering it round with gauze, they dip it again, and repeat the rest till it come to fit the cavity of the mortar: lastly, They sprinkle it around with gunpowder. This being once kindled, will strongly illuminate all around the place where it is thrown, and give opportunity to examine the state and condition thereof.

Smoke or Dark Bazes, those which fill the air with smoke, and thus darken a place to prevent discoveries. To prepare a darkening ball, make an aval or spherical bag, melt rosin over the coals, and add an equal part of saltpetre not purified, also of sulphur, and a sifth part of charcoal. The whole being well incorporated, put in tow first shred, and fill the bags with this composition, and dip it after the same manner as a fire ball.

Stink Barrs, those which yield a great fleach where fired to annoy the enemy. Their preparation is thus: Meht ten pounds of pitch, six of rosin, twenty of faltpetre, eight of gunpowder, and four of colophony; to these add two of charcoal, six of horse-hoos cut small, three of asasetida, one of stinking saracen, and any other offensive ingredients. The rest as in the former.

Sky Balls, those east on high out of mortars, and which, when arrived at their height, bursting like rockets, assord a spectacle of decoration. Sky balls are made of a wooden shell, filled with various compositions, particularly that of the stars of rockets. These are sometimes intermixed with crackers and other combustibles, making raise of fire, &c.

Water Balls, those which swim and burn a considerable time in the water, and at length burst therein. These are made in a wooden shell, the cavity of which is silled with refined satteet; sulphur, sawdust boiled in water of satteete, and dried; to which sometimes other ingredients are added, as iron silings, Greek pitch, amber dust, powdered glass, and camphor. The ingredients are to be ground, mixed up, and moistened with linseed oil, nut oil, olive oil, hempseed oil, or petrol. At the bottom is placed an iron cossin, filled with whole gunpowder, that the ball may at last busst with a greater noise: and, lastly, The ball is by the addition of lead or otherwise, made of the same specific gravity with water.

Land Barns are those which, being thrown out of a mortar, fall to the ground, burn, and burn there. The ingredients are much the fame as in the materially, only the specific gravity is not attended to.

BALLAGHAN, a town of Ireland, in the county of Sligo, and province of Connaught. W. Long. 9. 30. N. Lat. 53. 48.

BALLAN, a town of France, in the diocese of Mone, with the title of a marquifate, seated on the river Orne. E. Long. o. so. N. Lat. 48. 10.

BALLAD, a kind of fong, adapted to the capacity of the lower chase of people; who, being mightily taken with this species of poetry, are thereby not a little influenced in the conduct of their lives. Hence

we find, that feditious and deligning men never fail to Ballif fpread ballads among the people, with a view to gain them over to their fide.

BALLAST, any heavy matter, as flone, gravel, iron, &c. thrown into the hold of a finp, in order to make her fink a proper depth in the water, that she may be capable of carrying a sufficient quantity of fail without oversetting.

There is often great difference in the proportion of ballast required to prepare ships of equal burden for a voyage; the quantity being always more or less according to the sharpness or states of the ship's bottom, which seames call the floor.

The knowledge of ballafting a flip with propriety, is certainly an article that deferves the attention of the skilful mariner: for although it is known, that ships in general will not carry a sufficient quantity of sail till they are laden so deep that the surface of the water will mearly glance on the extreme breadth amid ships, yet there is more than this general knowledge required; since, if she has a great weight of heavy ballast, as lead, from, see. in the bottom, it will place the centre of gravity too low in the hold; and although this will enable her to carry a great sail, she will nevertheless sail very heavily, and run the risk of being dismasted by her violent rolling.

To ballait a ship, therefore, is the art of disposing those materials so that the may be duly possed, and maintain a proper equilibrium on the water, so as neither to be too stiff nor too crant, qualities equally pernicious: as in the first, although the ship may be sitted to carry a great fail, yet her relocity will not be proportionably increased; whilst her masts are more endangered by her sudden jerks and exercitive labouring; and in the last, she will be incapable of carrying fail, without the risk of oversetting.

Bliffings, in ballatting, is passifioned by disposing a great quantity of heavy ballatt, as lead, iron, &c. in the bottom, which naturally places the centre of gravity very near the keel; and that being the centre about which the vibrations are made, the lower it is placed, the more violent will be the motion of rolling.

Crankers, on the other hand, is accasioned by having too little ballsh, or by disposing the ship's lading so as to raise the centre of gravity too high, which also endangers the mast in carrying fail when it blows hard: for when the maste lase their perpendicular height, they strain on the through in the nature of a lever, which interestes as the sine of their obliquity; and a ship that loses her maste is in order danger of heing los.

lotes her masts is in great danger of being lost.

The whole art of ballatting, therefore, consists in placing the centre of the gravity to correspond with the trum and shape of the vessel, so as neither to be too high nor too low; neither too far forward nor too far ast, and to lade the ship to deep, that the surface of the water may nearly rise to the extreme breadth amidships; and thus she will be enabled to carry a good sail, incline but little, and ply well to the windward.

Ships are faid to be in ballass when they have no other loading. Masters of vessels are obliged to declare the quantity of ballass they bear, and to unload it at certain places. They are prohibited unloading their ballass in havens, roads, &c. the neglect of which has

Ballatoons ruined many excellent ports .- Ships and veffels taking Balliconnel ton to Trinity house, Deptford; who shall employ ballastmen, and regulate them; and their lighters to be marked, &c. on pain of 10l.

BALLATOONS, large heavy luggage boats used for carrying wood by the river from Astracan and the Caspian sea to Moscow. These will carry from 100 to 200 ton, and have from 100 to 120 men employed

to row and tow them along.

BALLENDEN (Sir John), a Scottish poet, in the reign of James V. of Scotland, was descended from an ancient family in that kingdom. His father, Mr Thomas Ballenden of Anchinoul, was director to the chancery in the year 1540, and clerk register in 1541. Where our poet was educated, we are not informed; but from one of his poems we learn, that in his youth he had some employment at the court of King James V. and that he was in great favour with that prince. Having taken orders, and being created doctor of divinity, at the Sorbonne, he was made canon of Role, and archdeacon of Murray. He likewise obtained the place of clerk register, but was afterwards deprived of that employment by the factions of the times; however, in the fucceeding reign of Mary, he recovered that office, and was one of the lords of fellion. Being a zealous Papith, he, in conjunction with Dr Laing, was extremely affiduous in retarding the progress of the Reformation; till at last, finding the opposition too powerful, he quitted Scotland, and went to Rome, where he died in the year 1550. He is generally esteemed one of the best Scottish poets of that age. Itis works are, I. The history and chronicles of Sectland of Heller Bons (Botthins), translated by Mr John Bullenden, Edinb. 1536. This is not a more translation, Ballenden having corrected feveral militakes of his author, and made large additions. It is in folio, and black letter. at Colmography to the history of Scotland, with a poetical poets.

2. A description of Albany. 4. Translation of Boethius's description of Scotland. 5. Epistics to King James V. Bale fays he had feen thefe letters. S. Beveral poems in Carmichael's collection of Scottish poems; besides many others in manuscript, in private libraries in Scotland. 7. Virtue and Vyce, a poem addressed to King James V.

BALLET, BALET, or BALLETTO, a kind of dramatic poem, representing some fabulous action or subject divided into several entries a wherein several perfons appear, and recite things under the name of fome. 1 18 1 at 194 1 deity, or other illustrious character.

Ballur is more particularly used for a kind of comic dance, confifting of a feries of feveral airs of different kinds of movements, which together represent some subject or action. They are performed chiefly by masks representing sylvans, tritons, nymphs, shepherds, and the like; and confift of three parts, the entry, figure, and the retreat. The word is of Greek origin, formed from Beddus, jasere, to cast, throw, or tols; whence also in writers of the middle age, we find ballationes for faltationes, dancings; and ballare for faltare to

BALLIAGE, or BAILIAGE, in commerce, a small duty paid to the city of London by aliens, and even denizens, for certain commodities exported by them.

BALLICONNEL, a town of Ireland, in the coun-Vol. II. Part II.

ty of Cavan, and province of Ulfter. W. Long. 7.45. Buildhan-N. Lat. 54. 6.

BALLISHANNON, a large town of Ireland, in Balloon the county of Donegal, or Tyrconnel, with a good haven. W. Long. 8. 25. N. Lat. 54. 25.

BALLISTA, a machine used by the ancients for shooting darts; it resembled in some measure our crossbow. The word is Latin, fignifying a cross-bow; and is derived from the Greek, Banks, to Short, or throw.

Vegetius informs us, that the ballifta discharged darts with fuch rapidity and violence, that nothing could refift their force : and Athenaus aids, that Agistratus made one of little more than two feet in length,

which shot darts 500 paces:
In Plate XCVII: is represented the ballista used in fieges, according to the chevalier Folard : 2, 2, the bafe of the ballilla ; 3, 4, upright beams; 5, 6, transverse beams; 7,7, the two capitals in the upper transverse beam, "(the lower transverse beam has also two finishes capitals, which cannot be feen in this transverse figure); 9, 9, two posts or supports for strengthening the transverie beams; 10, 10, two skams of cords failened to the capitals; 11, 11, two arms inferted between the two stands, or parts of the ikams; 12, a cord fallened to the two arms; 13, darts which are shot by the ballista; 14, 14, curves in the upright beams, and in the concavity of which cushions are fastened, in order to break the force of the arms which flrike against them with great force when the dart is discharged; 16, the arbor of the machine, in which a groove or canal perfeetly straight is formed, and in which the dirts are placed in order to their being that by the ballitla; 17, the nut of the trigger; 18, the roll or windlass, about which the cord is wound; 19, a hook, by which the cord is drawn towards the centre, and the bullifta cocked; 20, a stage or table on which the arbor is in part fustained.

BALLISTEUM, or BALLIST # 1, in antiquity, a military long or dance used on occasions of victory. Vopifcus has preferved the balifleum fung in honour of Aurelian, who in the Sarmatian war, was faid to have killed 48 of the enemy in one day with his own Mille, mille, mille, mille, mille mille decollavimus : Unus bomo mille, mille, mille, mille, decollavit : mille, mille, mille vivat, qui mille, mille accidit. Tar. time vine habet nemo, quantum fudit funguinis. fame writer Indioins another popular fong of the same kind : Mille Francos, mille Sarmatas, femel occidimus ; mille, mille, mille, mille, mille Perfas quarious. took the denomination ballifleum from the Greek Balle, jacio, or jaco, to calt or tols, on account of the motions used in this dance, which was attended with great elevations and fwingings of the hands. The bullifleat were a kind of popular ballads, composed by poets of the lower class, without much regard to the laws of metre.

BALLOON, or Ballon, in a general fenfe, fignifies any spherical hollow body, of whatever matter it be composed, or for whatever purposes it be designed. Thus, with chemifts, balloon denotes a round shortnecked veffel, used to receive what is distilled by means of fire; in architecture, a round globe on the top of a pillar; and among engineers, a kind of bomb made of patteboard, and played off, in fire-works, either in the air or on the water, in imitation of a real bomb.

Balloon || | Balls. Air-Balloon. See Aerostation and Air-Balloon. Palloon also denotes a kind of game fomething refembling tennic. The balloon is played in the open field, with a great round ball of double leather blown up with wind, and thus driven to and fro with the strength of a man's arm, sortified with a brace of wood.

BALLOON, OF BALLOEN, is more particularly used among voyagers for the flate barges of Siam. The balloons are a kind of brigantines, managed with oars, of very odd figures, as ferpeuts, fea horfes, &c. but, by their tharpness and number of oars, of incredible fwiftness. The balloons are said to be made of a single piece of timber, of uncommon length; they are raifed high, and much decorated with carving at head and ftern: fome are gilt over, and carry 120 or even 150 rowers on each fide. The oars are either plated over with filver, or gilt, or radiated with gold; and the dome or canopy in the middle, where the company is placed, is ornamented with fome rich fluff, and furnished with a balluftrade of ivory, or other coftly matter, enin hed with gilding. The edges of the balloon just rough the water, but the extremities rife with a fweep to a great height. Some are adorned with variety of figures, made of pieces of mother-of-pearl inlaid: the richer fort, inflead of a dome, carry a kind of fleeple in the middle; fo that, confidering the flenderness of the veilel, which is usually 100 or 120 feet long, and scarce is broad, the height of the two ends, and of the fleeple with the load of decorations, it is a kind of miracle they are not overfet.

BALLOON, in the Fr nch paper trade, is a term for

a quantity of paper, containing 24 reams.

Ballicon, Ballon, or Ballot, in the French glass trade, figurities a certain quantity of glass plates, smaller or greater according to their quality. The ballon of white glass contains 25 bundles, of fix plates per bundle; but the ballon of coloured glass is only of 124 bundle, and of three plates to a bundle.

BALLOTA, WHITE HOREHOUND: A genus of the gyn nospectual order, belonging to the didynamia class of plants; and in the natural method ranking under the 42d order, Verticillata. The calyx has 5 teeth, with 10 strue; and the upper lip of the corolla is crenated. It is a common weed growing on the sides of banks in most parts of England, as also in walkplaces near towns and villages in Scotland; so is feldom admitted into gardens. The slowers grow in whoils, upon branched peduncles, and lean on one side of the stalk; they are commonly of a dull red colour, but sometimes white. It was formerly used in hysteric cases, but is now fallen into disuse. The Sweden recken it almost an universal remedy in the diseases their cattle. Horses, cows, sheep, and goats, refuse to eat it.

BAILOTADE, in the manege, the leap of a horse between two pillars, or upon a straight line, made with justified of time, with the aid of the hand and the calves of the legal and in such a manner, that when his force feet are in the air, he shows nothing but the shoes of his hinder feet without yerking out.

BALLOTING, a method of voting at elections, &c by means of little balls usually of different colours, by the French called ballots; which are put into a box privately.

BALLS, or BALLETS, is heraldry, a frequent

bearing in coats of arms, usually denominated, according to their colour, bezants, plates, hurts, &c.

BALLUSTER, a fmall kind of pillar used for Balfum.

oalluitrade s

BALLUSTRADE, a feries or row of ballusters, joined by a rail; serving as well for a rest to the elbows as for a fence or enclosure to balconies, altais, staircases, &c. See Architecture, No 74.

BALM, in botany. See MFLISSA. BALM, or BALSAM. See BALSAM. B.IIM of Gilead. See AMYRIS.

BALNAVES (Henry), a Scottish Protestant divine, born in the shire of File, in the reign of James V. and educated at the university of St Andrew's. He went afterwards to France in order to finish his studies; and returning to Scotland, was admitted into the family of the earl of Arran, who at that time governed the kingdom: but in the year 1542 the earl difmiffed him for having embraced the Protestant religion. In 1564, he joined, fays Mackenzie, the murderers of Cardinal Beaton; for which he was declared a traitor, and excommunicated. Whilft that party were befieged in the callle of St Andrew's, they fent Balnaves to England, who returned with a confiderable fupply of provisions and money; but being at last obliged to furrender to the French, he was fent with the refl of the garrifon to France. He returned to Scotland about the year 1559; and having joined the congregation, he was appointed one of the commissioners to treat with the doke of Norfolk on the part of Queen Elizabeth. In 1563 he was made one of the lords of fession, and appointed by the general assembly, with other learned men, to revise the Book of Discipline, Knox, his cotemporary, and fellow labourer, gives him the character of a very learned and pious divine. He died at Edinburgh in the year 1579. He wrote, 1. A Treatify sourceming Justification. Edinb. 1550, 8vo. 2. A Carechifm, or Confession of Eaith. Edinb. 1584, 8vo.

BALNEARII Servi, in antiquity, servants or attendants belonging to the baths. Some were appointed to heat them, called fornicatores; others were denominated capfurit, who kept the clothes of those that went into them; others alipta, whose care it was to pull off the hair; others unquarii, who anointed and perfumed the body.

BALNEARIUS rue, in antiquity, a kind of thick who practifed stealing the clothes of persons in the baths; sometimes also called fur balnearum. The crime of those thieves was a kind of sacrilege; for the hot baths were facred: hence they were more severely punished than common thieves who stole out of private houses. The latter were acquitted with paying double the value of the thing stolen; whereas the former were punished with death.

BALNEUM, a term used by chemists to fignify a vessel silled with some matter, as fand, water, or the like, in which another is placed that requires a more gentle heat than the naked fire. See Chemistry, No 578.

BALSA, an ancient town of Lufitania, in the Ager

Cunana; now Tavira, capital of Algarva.

BALSAM, or NATIVE BALSAM, an oily, refinous, liquid fubflance, flowing either fpontaneously, or by means of incision, from certain plants. There are a great variety of balsams, generally denominated from

Balfamics the fubfiances from which they are obtained; and
which are explained under their names as they occur.
Balfamir BALSAMICS Bulfamir is a latter would alich

BALSAMICS. Balfamica is a Latin word which figurations matigating. The term balfamic is a very lax one; it includes medicines of very different qualities, as emollicities, detergents, refloratives, &c. but in measurements, dicines of all these kinds there seems to be this requirated Data site in them, viz. that they be soft, yielding, and adhesive, also that by their smallness they have a ready disposition to motion. Medicines of this tribe are generally required for compliants whose seat is in the viscera; and as they cannot be conveyed there but by the common road of the circulation, it follows, that no great effects can be expected from them but by their long continuation. Hossman calls by the name of balfamics those medicines which are hot and acrid, also the natural balfams, gums, &c. by which the vital heat is increased.

BALSORA. See Bassora.

BALTAGI, among the Turks, porters, and hewers of wood, in the court of the grand fignior; who also mount on horseback when the emperor rides out. Part of them also, who, for that purpose, must be cattrated, keep watch at the gates of the first and second courts of the sergilio. These last are called capizi, and their commander capigi pascha.

BALTIC sea, a great gulf furrounded by Sweden, Russia, Courland, Prusia, Pomerania, and Denmark. The king of Denmark levies a tax at Elsineur on every ship that enters the Baltic sea. It is remarkable that this sea neither ebbs nor slows, and there is always a current sets through the Sound into the ocean. It is generally frozen over three or four months in the year. Yellow amber is found in pleasy on this coast.

BALTIMORA, in botany: A genus of the polygamia necessaria order, belonging to the syngenesia class of plants. The receptaculum is chaffy; there is no pappus: the callyx is cylindrical and polyphyllous; and the ray of the corolla is quinquestrous. There is but one species, the recta, a native of Maryland.

BALTIMORE, a town of Ireland in the county of Corke, and province of Muniter, with the title of a barony. It is feated on a headland which vuns into the fea, five miles north-east of Cape Clear. W. Long. 9, 10. N. Lat. 51. 51.

BALTIMORE (county and town of), in America. See

BALTIMORE-Bird. See ORIGINAL

BALTZAR (Thomas), a native of Lubec, was an eminent mufical compofer, and effectived the finest performer on the violin of his time. He came into England in the year 1658, and lived about two years in the boule of Sir Anthony Cope of Hanwel in Oxfordthire. He was the great competitor of Davis Mell, who, though a clockmaker by trade, was, till Baltzar came hither, allowed to be the finest performer on the violin in England; and after his arrival he divided with him the public applause, it being agreed that Mell excelled in the fineness of his tone and the sweetness of his manuer, and Baltzar in the power of execution and command of the instrument. Moreover, it is faid of the latter, that he first taught the English the practice of shifting, and the use of the upper part of the singerboard. Daltzar was given to intemperance, and is faid to have shortened his days by excessive drinking; he

was buried in Westminster abbey on the 27th day of Baharlavo July 1663.

BALUCLAVO, or JAMBOL, a fea-port town of the Crimea on the Black fea, where they build ships for the Grand Signior. E. Long. 35. 15. N. Lat. 44. 50.

BALUZE (Stephen), a French writer, born in 1651, and fome time librarian to M. Colbert. In 1693 he obtained a pension, with the post of director of the Royal College, for writing the lives of the popes of Avignon; both which advantages he soon lost in the sluctuation of court parties. M. Baluze is much more noted for collecting ancient MSS, and illustrating them by notes, than famed for his own compositions.

BALYUR, or BALIUR, a fea-port of Africa in the kingdom of Dancali, about 14 hours journey west from Babel-Mandel. It is remarkable only for being the landing place of the Abyffinian patriarch Alphonfus Mendez, with his Jefuits and Portuguefe, on April 3d 1724. The king, who had received orders from the Abyllinian emperor to give them a proper reception, dispatched his fon to meet them and conduct them to him. The royal palace they found to confill of about half a dozen of tents, and a score of huts, fenced about with a thorn hedge, and shaded by some wild kinds of trees. Near the palace was a river, which was then quite dried up, and no water to be found but what was digged for in the channel. The hall of audience was only a large tent about a musket-shot from the rest. At the upper end was a kind of throne made of dones and clay, covered with a carpet, and two velvet cuthiens, At the other end was his majetly's horse, with the fact die and other accourrements hanging on one fide: it being the custom of this country for the master and horse to lie together, whether king or subject. A. round the hall were about 50 young men fitting croflegged; and when the Portuguese ambassadors were admitted, they were made to ht down in the fame pofture. Soon after came the king preceded by fonce of his domestics, one having an earthen putcher full of hydromel, another a cup made of porcelaire, a thust carrying a cocoa-shell full of tobacco, and a touth bringing a filver tobacco-pipe with fome fire. Next to them was the king, drofled in a light filk fluff, having on his head a turban, from the rims of which hung a parcel of rings nicely wrought, which dangled before his face. He had in his hand a fhort kind of pivelin, and was followed by all the chief officers of his count and household. The respect paid him at his coming in was by flanding on their feet, and squatting down again twice, after which they went forward to kils his

BALZAC (John Lewis Guez de), born at Angondeme in 1599. Voltaire allows him the merit of having given numbers and harmony to the French profe, but certifiers his flyle as fomewhat bomball. The critics of his own time gave him no little diffquiet; and he gave them no little advantage over him by his fallies of vanity, and fome particular propositions which were a little dangerous. M. Balzac, getting rid of these disputes by his moderation, settled at his country seat; refined his style and genus; and got by his letters and other writings which he published from time to time, the reputation of being the first writer in France. He was at length drawn from his retirement by the hopes of making his fortune under Cardinal Richelieu,

5 E'2

who

Bamba who had formerly courted his friendship; but in a few years he retired again, difgusted with the slavish dependence of a court life. All he obtained from the court was a pension of 2000 livres, with the titles of counfellor of flate and historiographer of France. He died in 1654: 2 d was buried in the hospital of Notre Dame des Anges, to which he bequeathed 12,000 livres. He left an estate of 100 franks per annum for a gold medal to be bestowed every two years for the best discourse on some moral subject. Besides his letters he wrote a work called Oeuvres Diverfer, i. e. on various Subjects; The Prince; The Christian Socrates, &c. and many other pieces; all of which have been published in two volumes folio.

BAMBA, a province of the kingdom of Congo in Africa. It is fituated between the rivers Ambrifi and Lofe; the last of which parts it from Pemba on the cast, as the Ambrish does from the province of Sogno on the north. Along the fea coasts it extends itself northward to the river Lelunda; and on the fouth to that of Danda, which parts it from the kingdom of Angola. The governors of this province bear the title of dukes, and are always some of the princes of the royal family. They are as despotic and arbitrary as if they were really kings, notwithflanding the care and pains their monarchs have taken to keep them within due bounds. 'The foil of this province is very fertile; and would produce all the necessaries of life in great plenty, were the inhabitants but industrious in its culinvation. The sea coasts produce a valt quantity of falt, which could be purified with little trouble, and would yield an extraordinary revenue if the duties were duly paid; but these the governors find means to fink mostly into their own coffers. Here is also the fishery of the zimbis, or little fea fnail, whose shell is the current coin not only in this and the neighbouring kingdoms, but also in the most distant parts of Africa. Here are also tand to be mines of gold, filver, quickfilver, copper, tin, and iron; but none except the iron mines are allowed to be worked.

BAMBERG, a large handsome town of Franconia in Germany, and capital of a bishoprick of the same name. It was formerly imperial, but is now subject to the bishop. The country about it produces plenty of corn, fruits, and liquorice. It has an university, founded in 1585; and is fituated at the confluence of the rivers Main and Reidnitz. E. Long. 10. 15. N. Lat. 50. 10.

BAMBERG, a town of Bohemia, fituated at the foot, of a mountain. E. Long. 15, 50. N. Lat. 49, 53.

BAMBOCCIO, a celebrated painter of convertetions, landfeapes, cattle, &c. was born at Lacren, near Narden, in 1613. His name was Peter Van Naer but in Italy they gave him the name of Bamboccio, on account of the uncommon shape of his body, the lower part being one third part longer than the upper, and his neck fo short that it was buried between his shoulders. He had, however, an ample amends for the unfeemliness of his limbs, in the Superior beauties of his mind; he was endowed with an extensive genius; and, indeed, had an univerfal talle for every part of painting. He refided at Rome for fixteen years fucceffively; every day studying to improve himself by those beautiful models which were continually open to his observation, and by the lovely scenery in the envi-

rons of that city. He was held in the highest esteem Bambocck by all ranks of men, as well as by those of his own pro- Bamboo fession; not only on account of his extraordinary abilities, but also for the amiable qualities of his mind. He studied nature incessantly; observing with a curious exactness every effect of light on different objects, at different hours of the day; and what loever incident afforded pleature to his imagination, his memory for ever perfectly retained. His ftyle of painting is fweet and true; and his touch delicate, with great transparency of colouring. His figures are always of a small fize, well proportioned, and correctly defigned; and although his subjects are taken but from the lower kind of nature, fuch as plunderings, playing at bowls, inns, farrier shops, cattle, or conversations; yet whatever he painted was fo excellently defigued, fo happily executed, and so highly finished, that his manner was adopted by many of the Italian painters of his time. His works are still universally admired, and he is justly ranked among the first class of the eminent masters. His hand was as quick as his imagination, fo that he rarely made sketches or defigns for any of his works; he only marked the subject with a crayon on the canvas, and finished it without more delay. His memory was amazing: for whatever objects he saw, if he considered them with any intention to infert them in his compositions, the idea of them was fo strongly impressed on his mind, that he could represent them with as much truth as if they were placed before his eyes. Sandrart observes, that although painters who are accustomed to a small fize are frequently inaccurate in the disposition of the different parts of their subject, seeming content if the whole appears natural; yet Bamboccio was as minutely exact in having his figures, trees, grounds, and di-flances, determined with the utmost precision and perspective truth, as the best masters usually are in pictures of the largest fize; which is one circumstance that causes the eye to be so agreeably deluded by the paintings of Bamboccib. In the latter part of his life, he was leverely tormented with an affirmatic complaint, which he endured with much impatience; and it is reported, that as the diforder feemed to him unsupportable, he threw himfelf into a canal to shorten his mifery, and was drowned. His death happened in 1673.

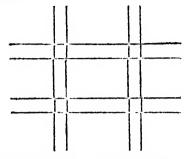

BAMBOE, in botany, the trivial name of a species

of arundo. See Agundo. BAMBOS-Habit; a Chinese contrivance by which a person who does not know how to swim may easily keep himfelf above water. The following account of

it is from a letter to the author of the Seaman's Prefervative. " In the year 1730, I was a pallenger in a thip from Batavia to China, burden about 400 tons, called the Pridae, Francisco Kavier commander, freighted by English, Chinese, and Portuguese. Near the coast of China we met with one of those storms called a Tuftoon (Tau fong), or a great wind, which carried away all our mails, bowsprit, and rudder; and in our hold we had fix feet of water, expecting every moment the ship would founder. We consequently were confulting our prefervation: the English and Portuguele stood in their shirts only, ready to be thrown off; but the Chinese merchants came upon deck, not in a cork jacket, but I will call it a bamboe habit, which had lain ready in their chefts against such dangers; and it was thus constructed; four bamboes, two before

Rambo-

and two behind their bodies, were placed horizontally, and projected about 28 inches. These were crossed on Bambuck, each fide by two others, and the whole properly fecured, leaving a space for their body; so that they had only to put it over their heads, and tie the fame feenrely, which was done in two minutes, and we were fatisfied they could not possibly fink." The shape is here subjoined.

BAMBOROUGH. See Hour-Island.

BAMBUCK, a country of Africa, of which the following account is given by the Abbé Raynal, on the credit of a modern traveller whom he does not name. " In the interior part of Africa, under the 12th or 13th degree of north latitude, there is (fays a modern traveller) a pretty large country, known by the name of Bambuck. It is not subject to a particular king; but governed by village lords, called furims. These hereditary and independent chiefs are all obliged to unite for the defence of the state, when it is either attacked as a community, or only in one of its branches.

"The territory of this aristocratical state is dry and barren. It produces neither maize, rice, nor pulse. The insupportable heat it is subject to, proceeds in part from its being furrounded by high mountains, which prevent the wind from refreshing the air. The climate is as unwholelome as it is difagreeable; vapours, which continually iffue from the bowels of a foil replete with minerals, render this country unfit to live in, espe-

cially to strangers.

" It is gold that hath made this miferable country an object worthy of notice; gold, which in the eyes of the covetous man feems to compensate for all the evils of nature, though in reality it increases them all. This metal is fo common in this country, that it is found almost indiscriminately everywhere. To obtain it, fometimes it is sufficient to scrape the surface of the carth, which is clayith, light, and mixed with fand. When the mine is very rich, it is digged only to the depth of a few feet, and never deeper; though it has been observed, that the lower it was digged, the more gold the foil afforded. The miners are too indolent to purfue a toil which constantly becomes more tedious. and too ignorant to perceive the conveniences it would be attended with. Their negligence and their folly are in this instance so extraordinary, that in washing the gold, in order to separate it from the earth, they only preserve the larger pieces; the light parts pass away with the water, which flows down an inclined plain.

"The inhabitants of Bambuck do not work thefe mines at all times, nor are they at liberty to do it.

when they please. They are obliged to wait till pri- Bamir. vate or public wants determine the farims to grant this permission. When it is proclaimed, all who are able to avail themselves of this advantage meet at the appointed place. When their work is finished, a division is made. Half of the gold goes to the lord, and the remainder is equally distributed among the labourers. Those who want gold at any other time than that of the general digging, fearch for it in the beds of the rivers, where it is very common.

" The French and English have successively been defirous of appropriating to themselves these real or imaginary riches. Some thought they could reach this country by the Niger, others by the Salum. Far from having succeeded in their attempts of becoming masters of this country, they have not yet afcertained its caistence. The unsuccessfuluess of past efforts bath redoubled the activity of fanguine minds; fenfible and judicious merchants have chofen to limit themselves to a commerce much more important, which is that of flaves."

BAMFF, a shire of Scotland, comprehending part of Buchan, with the counties of Strathdovern, Boyn, Enzic, Strathaven, and Balvenie, extends 32 miles from east to west, and 13 in breadth from north to fouth. On the fouth, it is separated from part of Buchan by the river Ugie; on the east it is watered by the Dovern and the German ocean; on the west it is bounded by the Spey and the county of Murray; on the fouth-west, it borders on Badenoch and the Braes of Mar; and on the north, it is confined by the Murray frith. The face of the country is agreeably diverfified with hill and dale, not without woods, well watered with rivers, and exhibiting many feats and plantations. The air is pure and keen, the chmate healthy, and the foil fertile, producing plentiful crops of corn. The county of Buchan, extending northwards from the river Ugie to the fea, and wellward as far as Dovern, comprehending a tract of 20 miles in length and nine in breath, is more free from hills and mountains than any other county of the fame extent in the kingdom of Scotland. It is inhabited chiefly by Lowlanders, and gives the title of earl to the family of Erskine; of which family, however, Erskine of Mar is the chief. The county of Bamii abounds with the necessaries and comforts of life. The patture grounds yield sheep, cattle, and horses: the arable lands produce plenty of corn; while the rivers and fea fupply great quantities of fish. Various minerals have been found in different parts of the thire; and a piece of amber, as large as a horse, was once cast ashore on the beach. In the mountainous diffrict of Balvenic on the western side of the shire, watered by the Spey, there is a noted rock, which produces hones and whetflones fufficient to supply the whole island. Here are also veins of alum stone, and springs of alum water. Stratualian, another diffrict to the north-eath of Balvenie, abounds with fuch plenty of limestone, that the inhabitants use it as common stone in building their houses; and moreover burn a great quantity of it intolime, which they fell to good advantage in the village of Keith, on the river Dovern. Along this whole coast, there are ancient Danish monuments, such as cairns, tumuli, and huge stones standing crect. In-Strathaven, a hilly country, lying along the limpid.

Bauca.

eiver Avin, which falls into the Spey, we meet with Gordon Castle, belonging to the duke of Gordon, the most princely edifice in the north of Scotland, consisting of noble apartments magnificently furnished, and environed with fine gardens and parks well stored with fallow deer. The fame nobleman possesses several other feats in this county.

BAMFF, the capital of the shire of that name in Scotland is pleasantly fituated on the fide of a hill, at the mouth of the river Dovern. It has feveral firects; of which that with the townhouse in it, adorned with a new spire, is very bandsome. This place was creeked into a borough by virtue of a charter from Robert II. dated October 7. 1372, endowing it with the fame privileges, and putting it on the same footing, with the buigh of Aberdeen; but tradition lays it was founded in the reign of Malcolm Canmore. It gives title of buron to a branch of the Ogilvie family. The harbour is very bad, as the entrance at the mouth of the Dovern is very uncertain, being often stopped by the shifting of the fands, which are continually changing in great ftorms; the pier is therefore placed on the outfide. Much falmon is exported from hence. About Troop Head fome kelp is made; and the adventurers pay the lord of the manor 50l. per annum for the liberty of collecting the materials. Near the town is a most magnificent feat lately built by the earl of Fife. It lies in a beautiful plain walhed by the Dovern, the lofty banks of which clothed with wood on the opposite fide, afford a delightful contrast to the fost vale beneath. W. Long. 2. 5. N. Lat 57. 40.

BAMIER, the name of a plant common in Egypt. It produces a pyramidal husk, with several compartments, of the colour of a lemon, and filled with musky feeds. This hufk dreffed with meat is wholesome food, and has a very agreeable flavour. The Egyptions make great use of it in their ragouts.

BAMIYAN, a city of Asia, situated in the prowince of Zablestan, 10 days journey from Balkh, and eight from Gazna. It is remarkable only for its dicadful catastrophe when taken by Jenghiz Khan in 1221. At that time the city belonged to Sultan Jalallodin, the last of the famous Mahmud Gazni's race. Jonhiz Khan was at that time about to attack Gazna, that prince's capital; but was stopped by the garrison of Gazna, which he had hoped would give him no trouble. In this, however, he was disappointed. The people had for a long time expected an attack; and had therefore ruined the country for five or fix leagues round, while the peafauts had carried away the flones, and every, thing that could be of use to the beliegers. Accordingly, Jenghiz Khan having crected wooden towers, and planted his engines upon them, was in a most time obliged to give over his attacks till millfrones and other materials could be brought from a great distance. The walls of the city were very strong, to that the engines of the Moguls made but little impression; and the garrifon making frequent and furious fallies, cut off whole squadrons of their enemics, and frequentof his inthrew their towers and engines. This exceedand, indagrined Jenghiz Khan; who one day returning painting, bitlels attack, and hearing of the defeat of cessively; generals by Jalallodin, swore to be revenged those beau an. This fury cost the life of one of his his observation; who exposing himself too much, to

pleafe his grandfather, was flain, with an arrow .- At Bamoth last, however, by the numberless multitude of the Moguls, who continued the attacks without intermiffion, the city was taken, after its walls had been mined in . many places, and the braveit foldiers and officers of the garrilon flain in its defence. The mother of the young prince who had been killed entering with the troops, and more deterving the name of a hend than a wuman, caused the throats of all the inhabitants to be cut, without excepting one. She even gave orders to tip up the bellies of all the women with child, that not an infant might be left alive. In thort to gratify the rage of this inhuman monfter, the buildings were all levelled with the ground; the cattle, and ever living cicature, destroyed; infomuch that the hardened Moguls themfelves gave this place the name of Maubalig, which in their language fignifies the unfortunate city. A strong castle has since been built out of it ruins.

BAMOTH-BALL (anc. geog.), one of the towns of the tribe of Reuben, which feems also to have had a temple of Baal on an enmeuce; lying eaftwards, and not far from the river Arnon, and the territory of Moab. Jerome calls it Bamoth, a city of the Amorites, beyond Jordan, in the policition of the fons of Reuhen. Whether the fame with that mentioned Numb. xxi. is doubtful, from the disagreement of ma terpreters; and yet we admit it to be the place of encampment of the Israelites, and of Balaam's first station, or where he had the first view of the rear of the people.

BAMTON, a town of Devonshire, situated in a bottom furrounded with high hills. W. Long. 4. 25. N. Lat. 51. 5.

BAN, or Bans. See Bann. "

BAN, in commerce, a fort of fmooth fine muslin, which the English import from the East Indies. The piece is almost a yard broad, and runs about 20 yards and a half.

BANANA TREE, a species of the musa or plan-See Musa.

BANARES, or Benares, a handsome town of Afia, in the dominions of the Great Mogul, greatly celebrated for its fanctity, and being the university of the Indian Bramins. See OBSERVATORY. It is feated on the north fide of the river Ganges, in E. Long. 82. 30. N. Lat. 26. 20. .

BANBURY, a town of Oxfordshire in England, fituated on the river. Charwell, in W. Long. 1. 20. N. Lat. 52. o. It lends one member to parliament.

BANC, or BENCA, in law denotes a tribunal, or judgment feat; hence king's bane is the fame with the court of king's bench, and common bane with that of common pleas. 15 4° ' 1 .

BANCI Jus, or the privilege of having a bench, was anciently only, allowed to the king's judges, qui fummam administrant justitiam. Inferior courts, as courts baron, hundred courts, &c. were not allowed. that prerogative; and even at this day the hundred court at Freibridge in Norfolk is held under an oak at Gey Wood; and that of Woolfry in Herefordshire, under an oak near Ashton in that county, called Hundred oak.

BANCA, an island of Asia in the East Indies, between Sumatra and Borneo; from theft of which it is separated only by a narrow c' . w. Long. 105. 10. N. Lat, 13. 25.

Bercalis Bazd ı.

BANCALIS, a sea port town on the east coast of the island of Samatra, where the Dutch have a fettle-

ment. E. Long. 99. 7. N. Lat. 1. 5.

BANCK (Peter Vander), an engraver of confiderable repute, was born at Paris, and received his instructions in the ait from the celebrated Francois de Poilly. He came over into England with Gafcar the painter, about the year 1674; and married the fifter of a gentleman of effate in Hertfordshire, named Forefter. He was a laborious artifl: but the pay he recoved for his plates being by no means adequate to the time he bestowed upon them, he was reduced to want; and, retiring from bufinels, fought an afylum in the house of his brother-in-law. He died at Bradfield, and was buried in the church there, in 1674; leaving his widow in possession of the chief part of his plates, which the disposed of to Brown a printfeller, to great advantage, and left an easy fortune.- His chief employment was engraving of portraits; and, according to Vertue's account of this artift published by the Hon. Mr Walpole, he was the first in England who engraved them on so large a scale. But even the novelty, it feems, added to their merit, could not fufficiently recommend them to support the artist. Like many of Poilly's disciples, his great merit, according to Mr Strutt, confists in the laboured neatness and management of the mechanical part of the art. Freedom, harmony, and chafteness of outline, are by no means the characteristic of his prints. However, though they cannot rank with the fuperior productions of Edelink or Nantueil, &c. they have their there of merit; and doubtless will be always esteemed in England as preferving the best resemblance of many eminent persons who were living at that time.

BANCO, an Italian word which fignifies bank. It is commonly used to figuify the bank of Venice.

BANCOCK, a town of the kingdom of Siam in Asia, with a fort, which was once in the possession of the French, but they were driven from it in 1688.

E. Long. 101. 5. N. Lat. 13. 25.
BAND, in a general fense, some small marrow ligament, wherewith any thing is bound, tied, or fast-

BAND, in architecture, a general name for any flat low member, or moulding, that is broad but not very

BAND of Suldiers, in military affairs, those who fight under the lame flag or enfign. 100 %

BAND of Pensioners, a company of 120 gentlemen, who receive a yearly allowance of tool, for attending

on his majerty on folemn occasions."

BAND is also the denomination of a military order in Spain, inflituted by Alphonfus X1. king of Caffile, for the younger fore of the nobility; who, before their admission, r all serve 10 years at least, either in the army or at court; and are bound to take up arms for the cathosic faith against the insidels.

BAND, in fingery. See BANDAGE.

BANDA 181 ANDS, the general name of five islands in the East Indies, belonging to the Dutch. Two of them are uncultivated, and almost entucly uninhabited; the other three claim the distinction of being the only islands in the world that produce the nutmeg.

If we except this valuable spice, the islands of Banda, like all the Molaceas, we barren to a dreadful degree. What they produce in superfluities they want in neces. Bandage faries. The land will not bring forth any kind of corn; and the pith of the fago ferves the natives of the country instead of bread.

Banditti.

As this food is not sufficient for the Europeans who fettle in the Moluccas, they are allowed to fetch provisions from Java, Macassar, or the extremely fertile island of Bali. The Company isfelf carries some merchandife to Banda.

This is the only fettlement in the East Indies that can be confidered as an European colony; because it is the only one where the Europeans are proprietors of lands. The Company finding that the inhabitants of Banda were favage, cruel, and treacherous, because they were impatient under their yoke, refolved to exterminate them. Their possessions were divided among the white people, who got flaves from fome of the neighbouring islands to cultivate the lands. These white people are for the most part Creoles, or malecontents who have quitted the fervice of the country. In the small island of Rosining, there are likewise several banditti, whom the laws have branded with difgrace; and young men of abandoned principles, whose families wanted to get rid of them : to that Banda is called the island of correction. The climate is so unhealthy, that these unhappy men live but a short time. It is on account of the lofs of fo great a number of hands, that attempts have been made to transfer the culture of the nutneg to Amboyna; and the Company were likewife probably influenced by two other flrong motives of it terest, as their trade would be carried on with less expence and greater fafety. But the experiment, that have been made have proved unfuccessful, and matters remain in their former state.

BANDAGE, in furgery, a fillet, roller, or fwath, used in dreffing and binding up wounds, restraining dangerous hemorrhagies, and in joining fractured and diffocated bones.

"BANDALEER, or BANDELEER, in military offairs, a large leathern belt, thrown over the right shoulder, and hanging under the left arm; worn by the ancient musqueteers, both for the sustaining of their sine arms, and for the carriage of their muffet charge. which being put up in little wooden cases, coated with leather, were hung, to the number of twelve, to each bandaleer.

BANDELET, or BANDLET, in architecture, any little band, or flat moulding, as that which crowns the Doric architrave.

BANDER congo, a small sea port town in Asia, feated on the Persian gulf. E. Long. 54. 10. N. Lat.

BANDERET, a general, or one of the commanders in chief of the forces, -This appellation is given to the mincipal commanders of the troops of the canton of Bern in Switzerland, where there are four banderets, who command all the forces of that canton.

BANDEROLL, a little flag, in form of a guidon, extended more in length, than in breadth, used to be

hung out on the malts of vessels, &c.

BANDITTI, from the Italian banditto; persons proferibed, or, as we call it, outlawed: fometimes denominated bannitti or forris banniti. It is also a denomination given to highwaymen or robbers who infell the roads in troops, especially in Italy, France,

Batte

Bangi

Banditti and Scily. Mr Brydone, in his Tour through Sicily, informs us, that in the eastern part, called I'al Demoni, Bandy-les from the devils that are supposed to inhabit Mount Ætna, it has ever been found altogether impracticable to extirpate the banditti; there being numberless eaverns and subterraneous passages round that mountain, where no troops could puffibly purfue them : befides, they are known to be perfectly determined and refolute, never failing to take a dreadful revenge on all who have offended them. Hence the prince of Villa Franca has embraced it, not only as the fafeft, but likewife as the wifest and most political scheme, to become their declared patron and protector: and fuch of them as think proper to leave their mountains and forests, though perhaps only for a time, are fure to meet with good encouragement and a certain protection in his fervice, where they enjoy the most unbounded confidence, which, in no influnce they have ever yet been found to make an improper or a dishonest use of. They are clothed in the prince's livery, yellow and green, with tilver lace; and wear likewise a badge of their honourable order, which entitles them to universal fear and respect from the people.

> In some circumstances, these banditti are the most respectable people of the island, and have by much the highest and most romantic notions of what they call their point of honour. However criminal they may be with regard to fociety in general; yet, with respect to one another, and to every person to whom they have once professed it, they have ever maintained the most unshaken sidelity. The magistrates have often been obliged to protect them, and pay them court, as they are known to be perfectly determined and desperate, and so extremely vindictive, that they will certainly put any person to death that has ever given them just cause of provocation. On the other hand, it never was known that any person who had put himself under their protection, and showed that he had confidence in them, had cause to repent of it, or was injured by any of them in the most minute trisle; but, on the contrary, they will protect him from impolitions of every kind, and fcorn to go halves with the landlord, like most other conductors and travelling fervants, and will defend him with their lives if there is occasion. Those of their number who have thus colified themselves in the service of society, are known and respected by the other banditti all over the island; and the persons of those they accompany are ever held facred. For these reasons, most travellers choose to hire a couple of them from town to town; and may thus travel over the whole island in fasety.

BANDORA, the capital of the illand of Sallet, on the west coast of the peninsula on this side the Garges, It is separated from the island of Bombay by a narrow channel, and subject to the Portuguele. E. Long. 72. 30. N. Lat. 19. 0.

BANDORE, the name of a mufical infirment with strings, refembling a late, and faid to be invented in the fourth year of Queen Elizabeth, by John Rose, a citizen of London.

BANDY-LEGS, from the French bander, 'to bend,' a distortion of the legs, when they turn either inward or outward on either fide; arifing from some defect in the birth comprudence in the nurse, endeavouring to make cold stand or walk before his legs were

ftrong enough to fuffaia the weight of his body. See

BANE (from the Saxon bana, a murderer), fignihes defluction or overthrow. Thus, " I will be the bane of fuch a man," is a common faying. So, when a person receives a mortal injury by any thing, we say, "it was his bane :" and he who is the cause of another man's death, is faid to be le bane, i. e. a malefac-

BANGLE BARS, an imperfection in a horse, remedied in the following manner: Place his ears in such a manner as you would have them fland; bind them with two little boards fo fast that they cannot stir, and then clip away all the empty wrinkled skin close by the

BANGIUS (Thomas), a Danish divine and an elegant Latin writer on the origin of languages and a variety of other subjects. He died in 1661.

BANGOR, an episcopal city of Caernaryonshire in North Wales. In ancient times it was fo confiderable, that it was called Banger the Great, and defended by a strong castle; but it is now a very mean place; the principal buildings being the cathedral, the bishop's palace, and a free school. The see is of very great antiquity, and its founder unknown. The church is dedicated to St Daniel, who was bishop here about the year 516; but for near 500 years afterwards, there is no certainty of the names of his successors. Glendower greatly defaced the cathedral church; but Bishop Dean repaired it again. The see met a still more cruel ravager than Owen Glendower, in the perfon of Bishop Bulkeley; who not only alienated many of the lands belonging to it, but even fold the bells of the church. This diocele contains the whole of Caernarvonshire except three parishes, the shire of Anglesey, and part of the thires of Denbigh, Merioneth, and Montgomery; in which are 107 parishes, whereof 36 are impropriated. It has three archdeaconries, viz. Bangor, Anglescy, and Merioneth; of which the two first are commonly annexed to the bishoprick for its better support. This fee is valued in the king's books at 1311. 16s. 4d. and is computed to be worth annually 1200l. The tenths of the clergy are 151l. 14s. 3id. To the cathedral there belong a bishop, a dean, an archideacon, a treatuter, and two prebendaries, endowed; a precentor, a chancellor, and three canons, not endowed; three vicars choral, an organist, lay clerks, chorifters, and two officers. W. Long. 4. 10. N. Lat.

BANGOR, a town of Ireland, in the county of Down and province of Ulster. It is seated on the sorth shore of the bay of Carrickfergus, opposite to the town of that name; and fends two members to parliament W. Long. 6. N. Lat. 54. 42.

BANGUE, a species of opiate, in great use throughout the cast, for drowning cares and inspiring joy .--This by the Perfians is called leng; by the Arabs, efficar, corruptly afferal, and affacib; by the Turks, lengitie, and vulgarly called maftack; by the European naturalists bangue or bange. - It is the leaf of a kind of wild hemp, growing in the countries of the Banians.

Bangue Levant; it differs little, either as to leaf or feed, from our hemp, except in fize. Some have millaken it for a species of althæa.

There are divers manners of preparing it, in different countries. Olearius describes the method used in Perfia. Mr Sale tells us, that, among the Arabs, the leaf is made into pills, or conferves. But the most distinct account is that given by Alexander Maurocordato counsellor and physician of the Ottoman Porte, in a letter to Wedelius. According to this author, bangue is made of the leaves of wild hemp, dried in the shade, then ground to powder; put into a pot wherein butter has been kept; fet in an oven till it begin to torrify: then taken out, and pulverised again; thus to be used occasionally, as much at a time as will lie on the point of a knife. Such is the Turkish bangue. The effects of this drug are, To confound the understanding; fet the imagination loose; induce a kind of folly and forgetfulness, wherein all cares are left, and joy and gaiety take place thereof. Bangue, in reality, is a fuccedaneum to wine, and obtains in those countries where Mahometanism is established; which prohibiting the ule of that liquor absolutely, the poor mullelmans are forced to have recourse to succedanca, to rouse their The principal are opium and this bangue. As to the opinion among Europeans, that the Turks prepare themselves for battle by a dole of bangue, which roufes their courage, and drives them, with eagernels, to certain death; Dr Maurocordato affures us, that it is a popular error: the Turks think they are then going afforedly to receive the crown of martyrdom; and would not, for any confideration, lofe the merit of it, which they would do, by eating the bangue, as being held unlawful by their apostle, among other things which intoxicate.

BANIALUCH, or BAGNALUCH, a city of European Turkey, the capital of Bosnia, upon the frontiers of Dalmatia, near the river Setina. E. Long. 18. 20.

N. Lat. 44. 20. BANIAN TREE. See Ficus.

BANIANS, a religious feet in the empire of the Mogul, who believe a metemplycholis; and will therefore eat no living creature, nor kill even noxious animals, but endeavour to release them when in the hands of others.—The name of Banian is used with some divertity, which has occasioned much confusion, and many millakes. Sometimes it is taken in a less proper tense, and extended to all the idolaters of India, as contradictinguished from the Mahometans; in which lense, Banians includes the Bramine and other cafes.

Banians, u a more proper kinte, is reference to a preculiar call, or tribe, of Indians, whole office or plan fellion is trade and merchandile i in which fente, Banions stand contradistinguished from Brahum; Cuttery, and Wyll, the three other calls into which the Indiana are divided. The four calls are absolutely separate as occupation, relation, marriage, &c. though all of the fame religion; which is more properly denominated the religion of the Bramins, who make the ecclefiastical tribe, than of the Banians, who make the mercantile. The proper Bunians are called, in the fuffer, a ok of their law, by the name of Shuddery; under which -are comprehended all who live after the manner of merchants, or that deal and transact for others, as brokers; exclusive of the mechanics, or artificers, who

make another cast, called Wyfe. These Banians have Binians. no peculiar fect or religion, unless it be, that two of the eight general precepts given by their legislator Bremaw to the Indian nation, are, on account of the profession of the Banians, supposed more immediately to relate to them, viz. those which enjoin veracity in their words and dealings, and avoiding all practices of circumvention in buying and felling .- Some of the Banians, quitting their possession, and reticing from the world, commence religious, assume a peculiar habit, and devote themselves more immediately to God, under the denomination of Vertea. These, though they do nor hereby change their call, are commonly reckoned as bramine of a more devout kind: much as monks in the Romish church, though frequently not in orders, are reputed as a more facred order than the regular clergy. The name Ranian imports as much, in the Bramin language (wherein their law is written), as a people innocent and harmlels; void of all guile; to gentle, that they gannot endure to fee either a fly or a worm injured a and who, when struck, will patiently bear it, without refifting or returning the blow .- Their mien and appearance is described by Lord *, in terms a little * Diff. or. precise, but very fignificant: " A people presented Peliz. Bathemselves to my eyes clothed in linen garments, some-way. what low descending, of a gesture and garb, as I may fay, maidenly, and well nigh effeminate, of a countenance shy and somewhat estranged."-Gemelli Careri divides the Banians into 22 tribes, all diffinct, and not allowed to marry with each other. Lord affures us they are divided into 82 easts or tribes, correspondent to the casts or divisions of the Bramins or priests, it is der whose discipline they are, as to religious matters; though the generality of the Banians choose to be under the direction of the two Bramin tribes, the Vifalnagranaugers and Vulnagranaugers.

The Banians are the great factors, by whom most of the trade of India is managed; in this respect, comparable to the Jews and Armenians, and not behind either, in point of skill and experience, in whatever relates to commerce. Nothing is hought but by their mediation. They seem to claim a kind of jus divinion to the administration of the traffic of the nation, grounded on their facred books, as the Bramins do to that of religion. They are dispersed, for this purpose, through all parts of Asia, and abound in Persia, particularly at Ispahan and Combroon, where many of them are extremely rich, yet not above acting as brokers, where a penny is to be got. The chief agents of the English, Dutch, and French East India are generally truded with the cash of those companies in the seeping. They are also as bankers, and can the bills of exchange for most cities in the East Infeminikable; being done without words, in the profounded filence, only by touching each other's fingers; the buyer loofening his pamerin or girdle, spreads it an his knee, and both he and the feller having their hands underneath, by the intercourse of the fingers, mark the price of pounds, fiftlings, &c. demanded, offered, and at length agreed on. When the feller takes the buyer's whole hand, it denotes a thouland; end, as many times as he fqueezes it, as many thoufand pagods, or rupees, according to the species in quellion,

Banier Bank.

question, are demanded: when he only takes the five fingers, it denotes five hundred; and when only one, one hundred: taking only half a finger, to the fecond joint, denotes fifty; the small end of the finger, to the sirst joint, stands for ten.

BANIER (Authony), licentiate in laws, member of the academy of inferiptions and belles lettres, and ecclefiaflic of the diocefe of Clermont in Auvergne; died in November 1741, aged 69. He is principally eclebrated for his translation of the Metamorphofes of Ovid, with historical remarks and explanations; which was published in 1732, at Amsterdam, in folio, finely ornamented with copperplates, by Picart; and reprinted at Paris 1738, in two vols. 4to: and for his Mythology, or fables of the ancients explained by history; a work full of the most important information, which was translated into English, and printed at London in 1741, 10 4 vols. 8vo.

BANISHMENT, exile, among us is of two kinds: the one voluntary and upon oath; the other by compulies, for fome offence or crime. The former properly called alignration, is now ceased; the latter is chiefly enjoined by judgment of parliament. Yet outlawing and transportation may also be considered as

fpecies of exile.

BANISTER (John), a physician and surgeon in the reign of Queen Elizabeth, was educated at Oxford, where, says Anthony Wood, he studied logicals for a time; but afterwards applied himself folely to physic and surgery. In 1573 he took the degree of bachelor of physic; and, obtaining a license from the university to practise, settled at Nottingham, where he lived many years in great repute, and wrote several medical treatises. His works were collected and published in 1633, 4to.

BANISTERIA, in botany: A genus of the trigynia order, belonging to the decandria class of plants; and in the natural method ranking under the 23d order, Tribilata. The calyx is quinquepartite, with nectarious porces on the outfide of the base; the petals are roundish and ungulated; the seeds are three, with membranaceous wings. There are seven species, all natives of warm countries, but possessing no remarkable properties.

BANK, in commerce, a common repository, where many persons agree to keep their money, to be always ready at their call or direction: or certain societies or communities, who take the charge of other people's money, either to improve it, or to keep it secure.

The first institution of banks was in Italy, where the Lombard Jews kept benches in the market places for the exchange of money and bills; and banks being the Italian name for bench, banks took their title from

this word.

1. Compa-

my banks.

Banks are of two principal kinds. I. One fort is either public, confilting of a company of moneyed men, who being duly established, and incorporated by the laws of their country, agree to deposite a considerable fund, or join shock, to be employed for the use of the society, as the money upon good security, buying and selling but and, discounting bills of exchange, &c.: or private, i. The tup by private persons, or partnerships, who dead in the same way as the former upon their own single slock and credit.

The greatest bank of circulation in Europe is the Bank of England. The company was incorporated by

parliament in the fifth and fixth years of King William and Queen Mary, by the name of The Governors and Company of the Bank of England: in confideration of England; the loan of 1,200,000l granted to the government; for the company are not to borrow under their regulations common feal, unlefs by act of parliament; they are not importance to trade, or fuffer any perfon in truft for them to trade, &c. in any goods or merchandife; but they may deal in buts of exchange, in buying or felling bulbon, and foreign gold and filver coin, &c.

By an act of parliament passed in the 8th and 9th year of William III. they were empowered to enlarge their capital stock to 2,201,1711. 108. It was then also enacted, that bank stock should be a personal, and not a real estate; that no contract either in word or writing, for buying or selling bank stock, should be good in law, unless registered in the books of the bank within 7 days, and the stock transferred in 14 days; and that it shall be felony, without benefit of clery, to counterfeit the common seal of the bank, or any fealed bank bill, or any bank note, or to alter or erase such bills or notes. By another act passed in the 7th of Queen Anne, the company were empowered to augment their capital to 4,402,343l. and they then advanced 400,000l. more to the government; and in 1714, they advanced ano-

ther loan of 1,500,000L

In the third year of the reign of King George I. the interest in their capital flock was reduced to 5 per cent. when the bank agreed to deliver up as many exchequer bills as amounted to 2,000,000l. and to accept an annuity of 100,000l. and it was declared lawful for the bank to call from their members, in proportion to their interests in the capital stock, such sums of money as in a general court should be found necessary. If any mentber should neglect to pay his share of the moneys so called for, at the time appointed by notice in the London Gazette, and fixed upon the Royal Exchange, it should he lawful for the bank, not only to stop the dividend of such member, and to apply it towards payment of the money in question, but also to stop the transfers of the share of such defaulter, and to charge him with an interest of 5 per cent. per annum, for the money so omitted to be paid; and if the principal and interest should be three months unpaid, the bank should then have power to fell fo much of the flock belonging to the defaulter as would fatisfy the same. After this, the bank reduced the interest of the 2,000,000l. lent to the government, from 5 to 4 per cent. and purchased feveral other annuities, which were afterwards redeemed by the government, and the national dibt due to the bank reduced to 1,600,000l. But in 1742, the company engaged to supply the government with 1,600,000l. at 3 per cent. which is now called the 3 per cent. annuities; fo that the government was now. indebted to the company 3,200,000l, the one Talf carrying 4, and the other 3 per cent-

In the year 1746, the company agreed that the sum of 986,800l, due to them in the exchequer bills unfatisfied, on the duties for licenses to fell spirituous liquosity retail, should be cancelled, and in lieu thereof to accept of an annuity of 39,442l, the interest of that sum at 4 per cent. The company also agreed to advance the further sum of 1,000,000l, into the exchanguer, upon the credit of the duties arising by the

and land tax at 4 per cent. for exchequer bills to be - issued for that purp se, in cornderation of which, the company were embled to augment their capital with 986,800l., the interest of which, is well as that of the other annuatic, wa reduced to 31 per cent till the 25th of December 1757, and from that time to carry only

And in order to enable them to circulate the faid excheques bill, they established what is now called bank circulition. The nature of which may be understood

from what follows .-

The company of the bank are obliged to keep cash fufficient not only to infiner the common, but also any extrandingly demind that may be made upon them: and whatever noney they have by them, over and above the fum ful poled necessary for these purposes, they employ in whit may be called the trade of the company; that is to fry, in discounting bills of exchange, in buying if sold and filver, and in government fecurities, &c. But when the bank entered into the above mentioned contract, as they did not keep unemployed a larger fum of money than what they deemed necessary to answer their ordinary and extraordinary demands, they could not conveniently take out of their current cash so large a fum as a million, with which they were obliged to furnish the government, without either lessening that fum they employed in discounting, buying gold and filver, &c (which would have been very disadvantagrous to them), or inventing some method that should answer all the purposes of keeping the million in cash. The method which they choic, and which fully anfuer, their end, was as follows .-

They opened a subscription, which they renew annually, for a million of money; wherein the fubicribers advance 10 per cent. and enter into a contract to pay the remainder, or any part thereof, whenever the bank shall call upon them, under penalty of forfeiting the 10 per cent. so advanced; in consideration of which, the bank pays the subscribers 4 per cent. interest for the money paid in, and i per cent. for the whole fum they agree to furnish; and in case a call shall be made upon them for the whole, or any part thereof, the bank further agrees to pay them at the rate of 5 per cent. per annum for such sum till they repay it, which they are under an obligation to do at the end of the year. By this means the bank obtains all the purposes of keeping a million of money by them; and though the subscribers, if no call is made upon them (which is in general the case), receive 61 per cent. for the money they advance, yet the company game the fum of 23,500l. per annum by the contract; as will appear by the following account:

The bank receives from the government The bank pays the subscribers who advance for the divance of a million 100,000l. and engage to pay (when called for) 900,000 merc 6,500

The clear gain to the bank therefore is 13,500

This is the state of the case, provided the company Bould make no call on the fublicribers; which they will be very townling to do, because it would not on-If lellen their profit, but affect the public credit in gedere.

Bank stock may not improperly be called a trading Bink. flock, fince with this they deal very largely in foreign gold and filver, in discounting bills of exchange, &c. Betides which, they are allowed by the government very confiderable tums annually for the management of the annuities paid at their office. All which advantages render a flur in then flock very valuable, though it company make dividends of the profits half yearly, ct which notice is publicly given; when those who have occasion for their money may readily receive it, but private persons, if they judge convenient, are permitted to continue their funds, and to have their interest added to the principal.

This company is under the direction of a governor. deputy-governor, and 24 directors, who are unfully elected by the general court, in the fime n inner a ra the Fast India company. Thirteen, or more, compose a court of directors for managing the affairs of the conpany. The officers of this company are very numerou

The stability of the bank of England is equal to the of the British government. All that it ha advanced to the public must be lost before its cicditors can instain any lois. No other banking company in Englin! can be established by act of pailiament, or can consist of more than fix members. It acts, not only as an or dinary bank, but (as we have already feen) as a great engine of state; receiving and paying the greater part of the annuities which are due to the cieditors of the public, circulating exchequer bills, and advancing 1, government the annual amount of the land and milt tixes, which are frequently not paid up till fome years thereafter It likewise has, upon several different occafions, supported the credit of the principal house, not only in England, but of Hamburgh and Holland, Upon one occation it is faid to have advanced for the purpole, in one week, about 1,000,000l a great plut of it in bullion.

In Scotland there are two public banks, both it I dinburgh. The one, called The Bent of So and, w st 1 1 10established by act of parhament in 1695, the other, called Toe Royal Bank, by royal charter in 172"

Within their 30 years there have also been erected private banking companie in almost every confideral le town, and even in fome villige Here the bulmers of the country is almost entirely carried on by pace currency, i. c. by the notes of those d flerent barking companies; with which purchases and paymer to of all kinds are commonly made. Silver ve y feldom appears. except in the change of a twenty fulling bank note, and gold still seldomer. But though the conduct of all those different companies has not been unexceptionable, had has accordingly required an act of parliament to where it , the country, notwithstanding, has evidentderived great bestellt from their trade. It has been afferted, that the trade of the city of Glasgow doubled in about as years after the first crection of the banks there's and that the trade of Scotland has more than quadrupled times the first erection of the two public banks to Edinburgh. Whether the trade, either of Scrutians in general, or of the city of Gallgow in particular, has really increased in to great a proportion, during fo thort a period, we do not pretend to know. If either of them has increased in this proportion, it feems to be an effect too great to be secounted for by 5 1 2

Bank the fole operation of this cause. That the trade and industry of Scotland, however, have increased very confiderably during this period, and that the banks have contributed a good deal to this increase, cannot be doubted.

Emile. Wealth of Nations, Book II. chap ii.

The value of the filver mouey which circulated in Scotland before the Union in 1707, and which immediately after it was brought into the bank of Scotland in order to be recoined, amounted to 411,1171. 10s. 9d. flerling. No account has been got of the gold coin; but it appears from the ancient accounts of the mint of Scotland, that the value of the gold annually coined fomewhat exceeded that of the filver. There were a good many people too upon this occasion, who, from a diffidence of repayment, did not bring their filver into the bank of Scotland; and there was, befides, fome Luglish coin, which was not called in. The whole ralue of the gold and filver, therefore, which circulated in Scotland before the Union, cannot, be estimated at less than a million sterling. It feems to have constituted almost the whole circulation of that country, for though the circulation of the bank of Scotland, which had then no rival, was confiderable, it feems to have made but a very small part of the whole. In the present times, the whole circulation of Scotland cannot be estimated at less than two millions, of which that part which confifts in gold and filver most probably does not amount to half a million. But though the circulating gold and filver of Scotland have suffered fo great a diminution during this period, its real riches and prosperity do not appear to have suffered any. Its agriculture, manufactures, and trade, on the contrary, the annual produce of its land, and labour, have evidently been augmented.

It is chiefly by discounting bills of exchange, that my orbible is, by advancing money upon them before they are due, that the greater part of banks and bankers issue their promissory notes. They deduct always, upon whatever fum they advance, the legal interest till the bill shall become due. The payment of the bill, when it becomes due, replaces to the bank the value of what had been advanced, together with a clear profit of the intereft. The banker, who advances to the merchant, whose bill he discounts not gold and filver, but his own promissory notes, has the advantage of being able to discount to a greater amount, by the whole value of his promiffory notes, which he finds by experience are commonly in circulation. He is thereby enabled. to make his clear gain of interest on fo much a larger fum.

The commerce of Scotland, which at present is not very great, was stell more inconsiderable when the two first banking companies were established; and those companies would have had but little trade, had they confined their bulinels to the discounting of bills of exchange. They invented, therefore, snother method of issuing their promissory notes, by granting what they called cash accounts; that is, by giving credit to the extent of a certain fam (2000), or 30001. for example), to any individual who could procure two per-This of undoulted credit and good landed ellate to be-Come furty for him, that whatever money should be advanced to him within the fum for which the credit had beer wen should be repaid upon demand, together with the legal interest. Credits of this kind are

commonly granted by banks and bankers in all differ- Bank. ent parts of the world. But the casy terms on which the Scots banking companies accept of repayment are peculiar to them, and have perhaps been the principal Advintage cause, both of the great trade of those companies from these and of the benefit which the country has received from

Whoever has a credit of this kind with one of those companies, and borrows 1000l. upon it, for example, may repay this fum piece-meal, by 201. and 301. at a time, the company discounting a proportionable part of the interest of the great fum from the day on which each of those small sums is paid in, till the whole be in this manner repaid. All merchants, therefore, and almost all men of business, find it convenient to keep such cash accounts with them; and are thereby interested to to the promote the trade of those companies, by readily re-banks, and ceiving their notes in all payments, and by encouraging all those with whom they have any influence to do the fame. The banks, when their cultomers apply to them for money, generally advance it to them in their own promissory notes. These the merchants pay away to the manufacturers for goods, the manufacturers to the farmers for materials and providons, the farmers to their landlords for rent, the landlords repay them to the merchants for the conveniences and luxuries with which they supply them, and the merchants again return them to the banks in order to balance their cash accounts, or to replace what they may have borrowed of them; and thus almost the whole money bufiness of the country is transacted by means of them. Hence the great tradeof those companies.

By means of those cash accounts, every merchant can, without imprudence, carry on a greater trade than he otherwise could do. If there are two merchants, to the one in London and the other, in Edinburgh, who em-countryploy equal flocks in the fame branch of trade, the Edinburgh merchant can, without imprudence, carry on a greater trade, and give employment to a greater number of people, than the London merchant. The London merchant must always keep by him a considerable fum of money, either in his own coffers, or inthose of his banker (who gives him no interest for it), in order to answer the demands continually coming upon him for payment of the goods which he purchases upon credit. Let the ordinary amount of this fum be supposed sool. The value of the goods in his warehouse mult always be less by good, than is would have been, had he not been obliged to keep such a sum un-employed. Let us suppose that he generally disposes. of his whole flock upon hand, or of goods to the value of his whole flock upon hand, once in the year. By being obliged to keep such a great sum unemplayed, he must sell in a year 5001, worth-lass goods than he might otherwise have done. His annual profits must be less by all that he could have made by the fale of 500l. worth more goods; and the number of people employed in preparing his goods for the market. must be less by all those that 500l, more stock could have employed. The merchant in Edinburgh, on the other hand, keeps no money unemployed for answering fuch occasional demands. When they actually come upon him, he fatisfies them from his cash account with the bank, and gradually replaces the fum borrowed with the money or paper which comes in from the oc-

Cath se-Comits.

With the fame flock, Bank. caffonal fales of his goods. therefore, he can, without imprudence, have at all times in his warehouse a larger quantity of goods than the London merchant; and can thereby both make a greater profit himfelf, and give constant employment to a greater number of industrious people who pre-pare those goods for the market. Hence the great benefit which the country has derived from this trade.

> The late multiplication of banking companies in both parts of the united kingdom, an event by which many people have been much alarmed, instead of diminithing, increases the security of the public. obliges all of them to be more circumfpect in their conduct, and, by not extending their currency beyond its due proportion to their cash, to guard themselves against those malicious runs which the rivalship of so many competitors is always ready to bring upon them. It reftrains the circulation of each particular company within a narrower circle, and reduces their circulating notes to a smaller number. By dividing the whole circulation into a greater number of parts, the failure of any one company, an accident which, in the course of things, must fometimes happen, becomes of less confrquence to the public. This free competition too obliges all bankers to be more liberal in their dealings with their customers, lest their rivals should carry them away. In general, if any branch of trade, or any division of labour, be advantageous to the public, the freer and more general the competition, it will always be the more for. See further, the article PAPERmoney.

. Banks of polite.

2: The other kind of banks coulift of fuch as are inflituted wholly on the public account, and are called Banks of Deposite's the nature of which not being genersily understood, the following particular explanation may not be unacceptable.

nith's Yealth of ook IV. up. iii. 🕠

The currency of a great flate, such as Britain, generally confids almost entirely of its own coin. Should this currency, therefore, be at any time worn, clipt, or otherwise degraded below its standard value, the state by a reformation of its coin can effectually re-establish its currency. But the currency of a small state, such as Genus or Hamburgh, can feldom confift altogether in its own coin, but must be made up, in a great meafure, of the coins of all the neighbouring flates with which its inhabitants have a continual intercourie. Such a flate, therefore, by reforming its coin, will not always be able to reform its currency. If foreign offle of exchange are paid in this currency, the uncertain value of any fum, of what is in its own nature to incertain, must render the enchange always very much against such a state, its currency being, in all spreign states, necessarily valued even below what it is worth. In order to remedy the inconvenience to which this difadvantages' ous exchange must have subjected their merchants, such fifall flates, when they began to attend to the interest of trade, have frequently enacted, that foreign bills of exchange of a certain value should be paid, not in common currency, but by an order upon, or by a transfer in, the books of a certain bank, established upon the credit and under the protection of the flate; this bank being always obliged to pay, in good and true money, exactly according to the standard of the state. The banks of Venice, Genoa, Amilerdam, Hamburgh, and

Nuremberg, feem to have been all originally established Bank' with this view, though foinc of them may have afterwards been made subtervient to other purposes. The money of fuch banks, being better than the common currency of the country, necessarily bore an agio, which was greater or fmaller, according as the currency was supposed to be more or less degraded below the standard of the state. The agio of the bank of Hamburgh, for example, which is faid to be commonly about 14 per cent. is the supposed difference between the good standard money of the state, and the clipt, worn, and diminished currency poured into it from all the neighbouring states.

Before 1609, the great quantity of clipt and worn

foreign coin, which the extensive trade of Amsterdam

brought from all parts of Europe, reduced the value of its currency about 9 per cent. below that of good money fresh from the mint. Such money no sooner appeared, than it was melted down or carried away, as it always is in such circumstances. The merchants, with pleuty of currency, could not always find a fufficient quantity of good money to pay their bills of exchange; and the value of those bills, in spite of several regulations which were made to prevent it, became in a great measure uncertain. In order to remedy these inconveniences, a Bank of bank was established in 1609 under the guarantee of Amsterthe city. The bank received both foreign coin, and the dam, one of light and worn coin of the country, at its real and in the most fatrinsic value in the good standard money of the coun-list inflatintry, deducting only so much as was necessary for de-tion, regufraying the expence of comage, and other necessary larger, itteexpence of management. For the value which remained lity, &c. after this small deduction was made, it gave a credit in its books. This credit was called bank-money; which, as it represented money exactly according to the flandard of the mint, was always of the same real value, and intrinfically worth more than current money. It was at the same time enacted, that all bills drawn upon or ucgotiated at Amiterdam of the value of 600 gilders and

upwards should be paid in bank-money, which at

once took away all uncertainty in the value of those

bills. Every merchant, in consequence of this regu-

lation, was obliged to keep an account with the bank in order to pay his foreign bills of exchange, which

necessarily occasioned a certain demand for bank mo-

Bank money, over and above both its intrinsic superriority to currency, and the additional value which this demand necessarily gives it, has likewife some other advantages. It is fecure from fire, robbery, and other accidents; the city of Amsterdam is bound for it; it can be paid away by a simple transfer, without the trouble of counting, or the risk of transporting it from one place to another. In confequence of those different adventages, it feetes from the beginning to have borne an agio; and it is generally believed that all the money originally deposited in the bank was allowed to remain there, nobody caring to demand payment of a debt . which he could fell for a premium in the market. Befides, this money could not be brought from those coffers, as it will appear by and by, without previously paying for the keeping.

Thosedeposites of coin, or which the bank was bound to restore in coin, constituted the original capital of the bank, or the whole value of what was represented by

what is called bank money. At prefent they are supposed to constitute but a very small part of it. In order to facilitate the trade in bullion, the bank has been for thele many years in the practice of giving credit in its books upon depolites of gold and filver bullion. This credit is generally about 5 per cent. below the mint price of such bullion. The bank grants at the same time what is called a recipice or receipt, entitling the person who makes the deposite, or the bearer, to take out the bullion again at any time within fix months, upon re-transferring to the bank a quantity of bankmoney equal to that for which credit had been given in its books when the deposite was made, and upon paying & per cent. for the keeping, if the deposite was in filver, and 1 per cent. if it was in gold; but at the same time declaring, that in default of fuch payment, and upon the expiration of this term, the deposite should belong to the bank at the price at which it had been received, or for which credit had been given in the transfer books. What is thus paid for the keeping of the deposite may be considered as a fort of warehouse rent; and why this warehouse rent should be so much dearer for gold than for filver, several different reasons have been assigned. The fineness of gold, it has been said, is more difficult to be afcertained than that of filver. Frauds are more eafily practifed, and occasion a greater loss in the more precious metal. Silver, besides, being the flandard metal, the flate, it has been faid, wishes to encourage more the making of deposites of

filver than those of gold.

Deposites of bullion are most commonly made when the price is fomewhat lower than ordinary; and they are taken out again when it happens to rife. In Holland the market price of bullion is generally above the mint price, for the same reason that it was so in England before the late reformation of the gold coin. The difference is faid to be commonly from about fix to fixteen flivers upon the mark, or eight ounces of filver of cleven parts fine and one part alloy. The bank price, or the credit which the bank gives for depolites of fuch filver (when made in foreign coin, of which the finencls is well known and afcertained, such as Mexico dollars), is 22 gilders the mark; the mint price is about 23 gilders; and the market price is from 23 gilders fix to 23 gilders fixteen flivers, or from 2 to 3 per cent. above the mint price. The proportions between the bank price, the mint price, and the market price, of gold bullion are nearly the fame. A person can generally fell his receipt for the difference between the mint. price of bullion and the market price. A receipt for bullion is almost always worth something; and it very feldom happens, therefore, that any body fuffers his receipt to expire, or allows his bullion to fall to the bank. at the price at which it had been received, either by not taking it out before the end of the fix months, or by neglecting to pay the & or & per cent. in order to obtain a new receipt for another fix months. This, however, though it feldom happens, is faid to happen. fometimes, and more frequently with regard to gold than with regard to filver, on account of the higher warehouse rent which is paid for the keeping of the ac, more precious metal.

had be be person who by making a deposite of bullion obther with a bank-credit and a receipt, pays his bills ofas they become due with his bank-credit; and

either fells or keeps his receipt, according as he judges that the price of bullion is likely to rife or fall. The receipt and the bank-credit feldom keep long together, and there is no occation that they should. The person who has a receipt, and who wants to take out bullion finds always plenty of bank-credits or bank-money to buy at the ordinary price; and the person who has bank-money, and wants to take out bullion, saids receipts always in equal abundance.

The owners of bank-credits and the holders of receipts constitute two different forts of creditors against the bank. The holder of a receipt cannot draw out the bullion for which it is granted, without re-affigning to the bank a fum of bank-money equal to the price at which the bullion had been received. If he has no bank money of his own, he must purchase it of those who have it. The owner of bank money cannot draw out bullion without producing to the bank receipts for the quantity which he wants. If he has none of his own, he must buy them of those who have them. The holder of a receipt, when he purchases bank money, purchases the power of taking out a quantity of bullion, of which the mint price is 5 per cent. above the bank price. The agio of 5 per cent. therefore, which he commonly pays for it, is paid, not for an imaginary, but for a real value. The owner of bank money, when he purchases a receipt, purchases the power of taking out a quantity of bullion, of which the market price is commonly from 2 to 3 per cent. above the mint price. The price which he pays for it, therefore, is paid likewife for a real value. The price of the receipt, and the price of the bank money, compound or make up between them the full value or price of the bullion.

Upon deposites of the coin current in the country, the bank grants receipts likewife as well as bank-credits; but those receipts are frequently of no value, and will bring no price in the market. Upon ducatoons, for example, which in the currency pass for three gilders three stivers each, the bank gives a credit of three gilders only, or 5 per cent. below their current value. grants a receipt likewise chtitling the bearer to take out the number of ducatoons deposited at any time within fix months, upon paying 4 per cent. for the keeping. This receipt will frequently bring no price in the market. Three gilders bank-money generally. fell in the market for three gilders three flivers, the full's value of the ducatoons if they were taken out of the bank; and before they can be taken out, 'a per cent. mult be paid for the keeping, which would be mere less to the holder of the receipt. If the agio of the hank, however, should at any time fall to 3 per cent. fuch receipts might bring some price in the market, and might sell for 11 per cent. But the agio of the bank being now generally about 5 per cent. fuch. receipts are frequently allowed to expire, of, 198 they? express it, to fall to the bank. The's per cent. Which the bank gains, when deposites either of coin or bul lion are allowed to fall to it, may be confidered as the. warehouse rent for the perpetual keeping of such do-

The fum of bank-money for which the receipts are expired must be very confiderable. It must/comprehend the whole original capital of the bank, which, it is generally supposed, has been allowed to remainthere from the time it was first deposited, nabady.

Bank. caring either to renew his receipt or to take out his f is the interest of the owners of bank money, on the Burk. depolite, as, for the reasons already assigned, neither the one nor the other could be done without lofs. But whatever may be the amount of this fum, the proportion which it bears to the whole mass of bank money is supposed to be very small. The bank of Amsterdam has for these many years past been the great warehouse of Europe for bullion, for which the receipts are very feldom allowed to expire, or as they express it, to fall to the bank. The far greater part of the bank money, or of the credits upon the books of the bank, is suppoled to have been created, for these many years palt, by fuch deposites which the dealers in bullion are continually both making and withdrawing.

No demand can be made upon the bank but by means of a recipice or receipt. The smaller mass of bank money, for which the receipts are expired, is mixed and confounded with the much greater mass for which they are still in force; fo that, though there may be a confiderable fum of bank money for which there are no receipts, there is no specific sum or portion of it which may not at any time be demanded by one. The bank cannot be debtor to two perfors for the fame thing; and the owner of bank money who has no receipt cannot demand payment of the bank till he buys one. In ordinary and quiet times, he can find no difficulty in getting one to buy at the market price, which generally corresponds with the price at what he can sell the coin or bullion it entitles him to take out of the bank.

It might be otherwise during a public calamity: an invalion, for example, such as that of the French in 1672. The owners of bank money being then all eager to draw it out of the bank, in order to have it in their own keeping, the demand for receipts might raife their price to an exorbitant height. The holders of them might form extravagant expectations, and, instead of 2 or 5 per cent. demand half the bank money for which credit had been given upon the deposites that the reccipts had respectively been granted for. The enemy, informed of the constitution of the bank, might even buy them up in order to prevent the carrying away of the treasure. In such emergencies, the bank, it is supposed, would break through its ordinary rule of making payment only to the holders of receipts. The holders of receipts, who had no bank money, must have received within 2 or 3 per cent. of the value of the deposite for which their respective receipts had been granted. The hank, therefore, it is faid, would in this case make no scruple of paying, either with money or bullion, the full value of what the owners of bank money who could get no receipts were credited for in its books; paying at the same time 2 or 3 per cent. to such holders of receipts as had no bank money, that being the whole value which in this state of things could justly, be supposed due to them.

Ever in ordinary and quiet times it is the interest of the holders of receipts to deprefs the agio, in order cither to buy bank money (and confequently the bullion which their receipts would then enable them to take out of the bank) fo much cheaper, or to fell their receipts to those who have I ink money, and who want to take out bullion, fo much dearer; the price of a reecipt being generally equ. to the difference between the market price of bank money and that of the coin or bullion for which the receipt had been granted. It contrary, to raife the agio, in order either to fell their bank money fo much dearer, or to buy a receipt fo much cheaper. To prevent the flock-jobbing tricks which those opposite interests might sometimes occafion, the bank has of late years come to a refolution to fell at all times bank money for currency, at 5 per cent. agio, and to buy it again at 4 per cent. agio. In confequence of this refolution, the agio can never either rife above 5 or fink below 4 per cent. and the proportion between the market price of the bank and that of current money is kept at all times very near to the proportion between their intrinsic values. Before this refolution was taken, the market price of money used fometimes to rife fo high as 9 per cent. agio, and fome. times to fink fo low as par, according as opposite inte-

rests happened to influence the market.

The bank of Amsterdam professes to lend out no part of what is deposited with it, but, for every gilder to. which it gives credit in its books, to keep in its repofitories the value of a gilder either in money or bulben. That it keeps in its repositories all the money or bullion for which there are receipts in force, for which it is at all times liable to be called upon, and which, in reality, is continually going from it and returning to it again, cannot well be doubted. But whether it does fo likewife with regard to that part of its capital for which the receipts are long ago expired, for which in ordinary and quiet times it cannot be called upon, and which in reality is very likely to remain with it for ever, or as long as the States of the United Provinces fubfilt, may perhaps appear more uncertain. At Amflerdam, however, no part of faith is better chablished, than that for every gilder circulated as bank money there is a correspondent gilder in gold and filver to be found in the treasure of the bank. The city is guarantee that it should be fo. The bank is under the direction of the four reigning burgomafters, who are changed every year. Each new fet of burgomallers vifits the treasure, compares it with the books, receives it upon oath, and delivers it over, with the famou awnul folemaity, to the fet which succeeds it; and in that i -ber and religious country oaths are not yet didregarded. A rotation of this kind feems alone a fufficient from tv against any practices which cannot be avowed. Amidi all the revolutions which faction has ever occasioned in the government of Amsterdam, the prevailing party has at no time accused their predecessors of infidelity in the administration of the bank. No acculation could, have affected more deeply the reputation and fortune of the differenced party; and if such an acculation could have been supported, we may be affured that it would have been brought. In 1672, when the French king was at Utrecht; the bank of Amsterdam paid so readily as left no doubt of the fidelity with which it had obferved its engagements. Some of the pieces which were then brought from its repositories appeared to have been scorched with the fire which happened in the townhouse foun after the bank was established. Those pieces, therefore, must have lain there from that time.

What may be the amount of the treasure in the bank is a question which has long employed the speculations of the curious. Nothing but conjecture can be offered concerning it. It is generally reckoned, that there are about 2000 people who keep accounts with the bank; and allowing them to have, one with another, the value of 1500l. lying upon their respective accounts (a very large allowance), the whole quantity of bank money, and consequently of treasure in the bank, will amount to 3,000,000l. or, at 11 gilders the pound sterling, 33,000,000 of gilders; a great sum, and sufficient to carry on a very extensive circulation, but vastly below the extravagant ideas which some people have formed of this treasure.

The city of Amsterdam derives a considerable revenue from the bank. Befides what may be called the warehouse rent above-mentioned, each person, upon first opening an account with the bank, pays a fee of 10 gilders; and for every new account, 3 gilders 3 flivers; for every transfer, 2 flivers; and if the transfer is for less than 300 gilders, 6 flivers, in order to discourage the multiplicity of small transactions. The person who neglects to balance his accounts twice in the year forfeits 25 gilders. The perfon who orders a transfer for more than is upon his account, is obliged to pay 3 per cent. for the fum overdrawn, and his order is let afide into the bargain. The bank is supposed, too, to make a confiderable profit by the fale of the foreign coin or bullion which fometimes falls to it by the expiring of receipts, and which is always kept till it be fold with advantage. It makes a profit likewife by felling bank money at 5 per cent. agio, and buying it at 4. These different emoluments amount to a good deal more than what is necessary for paying the salaries of officers, and defraying the expence of management. What is paid for the keeping of bullion upon receipts, is alone supposed to amount to a neat annual revenue of between 150,000 and 200,000 gilders. Public utility, however, and not revenue, was the original object of this inflitution. Its object was to relieve the merchants from the inconvenience of a difadvantageous exchange. The revenue which has arifen from it was unforeseen, and may be confidered as accidental.

Bank, in fea affairs, denotes an elevation of the ground or bottom of the fea, so as sometimes to surmount the surface of the water, or at least to leave the water so shallow as usually not to allow a vessel to remain associated very it.—In this sense, bank amounts to much the same as stat, shoal, &c. There are banks of sand, and others of stone, called also shelves, or rocks. In the north-sea they also speak of banks of see, which are large pieces of that matter floating.

BANKER, a person who traffics and negotiates in money; who receives and remits money from place to place by commission from correspondents, or by means of bills or letters of exchange, &c.

The nucient bankers were called argentarii, and nummularii; by the Greeks, rearefulas, unhausseas, and negyogaposses. Their chief business was to put out the money of private persons to interest a they had their boards and benches, for this purpose, in all the markets the public places, where they took in the money from some, to lend it to others.

MANKING, the making of banks to oppose the fired of the sea, rivers, or the like, and secure the land from being overflowed thereby. With respect to the water which is to be kept out, this is called banking; with respect to the land, which is hereby to be defended, imbanking.

BANKING is also applied to the keeping a bank, or

the employment of a banker. Banking, in this fense, fignifies the trading in money, or remitting it from place to place, by means of bills of exchange. This answers to what the French call faire la hanque. In France, every body is allowed to bank, whether merchant or not; even foreigners are indulged in this kind of traffic. In Italy, banking does not derogate from nobility, especially in the republic states; whence it is, that most of the younger sons of great families engage in it. In reality, it was the nobility of Venice and Genoa, that for a long time, were the chief bankers in the other countries of Europe.

BANKISH, a province of the Mogul's dominions, in the north part of the Hither India, lying fouth-

west of the province of Cassimere.

BANKRUPT, (boncus ruptus), is so called, because when the bank or stock is broken or exhausted, the owner is faid to be a lankrupt .. And this word bankrupt is derived from the French banqueroute, which fignifies a breaking or failing in the world : langue in French is as much as menfa in Latin, and route is the Same as veffigium ; and this term is said to be taken originally from the Roman menfirii, which were fet in public places; and when a tradelman flipped away with an intention to deceive his creditors, he left only fome veffigia or figns of his table or shop behind him. But a bankrupt with us, from the feveral descriptions given of him in our flatute law, may be defined "a trader, who fecretes himfelf, or does certain other acts tending to defraud his creditors." For the better understanding of this article, it will be proper to consider, 1. Who may become a bankrupt : 2. What alls make a bankrupt : 3. The proceedings on a commission of bankruptcy: and, 4. In what manner an estate in goods and chattels may be transferred by bankruptcy.—But of these, the two last being treated under the article Commission of Bankruptey, the two first only belong to this place.

1. A bankrupt was formerly confidered merely in the light of a criminal or offender, and in this spirit we are told by Sir Edward Coke, that we have fetched as well the name, as the wickedness, of bankrupts from foreign nations. But at prefent the laws of bankruptey are confidered as laws calculated for the benefit of trade, and founded on the principle of humanity as well as justice; and to that end they confer some privileges not only on the creditors, but also on the bankrupt or debtor himself. On the creditors; by compelling the bankrupt to give up all his effects to their use, without any fraudulent concealment: on the debtor, by exempting him from the rigour of the general law, whereby his person might be confined at the discretion of his creditor, though in reality he has nething to fatisfy the debt; whereas the law of bankripts, taking into confideration the sudden and unavoidable accidents to which men in trade are liable, has given them the liberty of their persons, and some pecuniary moluments, upon condition they furrender up their Whole estate to be divided among their creditors.

In this respect our legislature seems to have attended to the example of the Roman law. We mean not the Black terrible law of the twelve tables, whereby the creditors Cerm might cut the debtor's body into pieces, and each of 472, them take his proportionable share: if indeed that law, de debitore in parter secando, is to be understood in so very batcherly a light; which many learned men have

Bankrupt, with reason doubted. Nor do we mean those less inhuman laws (if they may be called fo, as their meaning is indifputably certain), of imprisoning the debtor's person in chains; subjecting him to stripes and hard labour, at the mercy of his rigid creditor; and sometimes felling him, his wife, and children, to perpetual foreign flavery trans Tiberim (A) 1 an oppression which produced fo many popular infurrections, and feeeffions to the mons facer. But we mean the law of cession, introduced by the Christian emperors; whereby, if a debtor ceded or yielded up all his fortune to his creditors, he was fecured from being dragged to a gaol, " omni quoque corporali cruciatu femoto." For, as the emperor justly observes, inhumanum erat spoliatum fortames fuis in folidum damnari." Thus far was just and reasonable: but as the departing from one extreme is apt to produce its opposite, we had it afterwards enacted, that if the debtor by any unforeseen accident was reduced to low circumstances, and would fwear that he had not sufficient left to pay his debts, he should not be compelled to cede or give up even that which he had in his poileffion; a law which, under a false notion of humanity, seems to be fertile of perjury, injustice, and abfurdity.

> The laws of England, more wifely, have fleered in the middle between both extremes: providing at once against the inhumanity of the creditor, who is not fuffered to confine an honest bankrapt after his effects are delivered up; and at the fame time taking care that all his just debts shall be paid, so far as the effects will extend. But full they are cantious of encouraging prodigality and extravagance by this indulgence to debtors; and therefore they allow the benefit of the laws of bankruptcy to none but actual traders; fince that fet of men are, generally speaking, the only perfons liable to accidental losses, and to an inability of paying their debts, without any fault of their own. If persons in other fituations of life run in debt without the power of payment, they must take the consequences of their own indifcretion, even though they meet with fudden accidents that may reduce their fortunes: for . the law holds it to be an unjustifiable practice, for any person but a trader to encumber himself with debts of any confiderable value. If a gentleman, or one in a liberal profession, at the time of contracting his debts, shas a fufficient fund to pay them, the delay of payment is a species of dishonesty, and a temporary inju-Rice to his creditor; and if, at such time, he has not inflicient funds, the diffionesty and injustice is the greater. "He cannot therefore murmur, if he fuffers the punishment which he has voluntarily drawn upon kimfelf. But in mercantile transactions the case is far otherwise. Trade council be carried on without mutual credit on both fides: the contracting of debts is therefore here not only justifiable but necessary. And if, by accidental calamities, as by the lofs of a ship in a tempest, the failure of brother traders, or by the non-payment of perfous out of trade, a merchant or trader becomes incapable of discharging his own debts, it is his misfortune and not his fault. To the misfortunes therefore Vol. II. Part II.

of debtors, the law has given a compafficuate remedy, Binkeupt. but demed it to their faults : fince, at the fame time that it provides for the feculity of commerce, by enacting that every confiderable trader may be declared a bankrupt, for the benefit of his creditors as well as hunfelf, it has also, to discourage extravagance, declared, that no one shall be capable of being made a bankrupt, but only a trader; nor capable of receiving the full benefit of the flatutes, but only an industrious trader.

In the interpretation of the feveral flatutes made concerning English bankrupts, +, it hath been hell, + 34 Head that buying only, or felling only, will not qualify at Ill. c. 4 man to be a bankrupt; but it must be both buying 13 Flor e. 7. and felling, and also getting a livelihood by it: 118, by 21 Jec. 1. exercifing the calling of a merchant, a grocer, a mer-s (see, II. cer, or, in one general word, a chapman, who is one case. that buys and fells any thing. But no handicraft occupation (where nothing is bought or fold, and therefore no extensive credit, for the stock in trade, is not necoffary to be had) will make a man a regular bankrupt; as that of a husbandman, a gardener, and the like, who are paid for their work and labour. Also an innkeeper cannot, as fuch, be a bankrupt: for his gain or levelihood does not arise from buying and felling in the way of merchandife, but greatly from the use of his rooms and furniture, his attendance, and the like: and though he may buy corn and victuals, to fell again at a profit, yet that no more makes him a trader, than a schoolmaster or other person is, that keeps a bourding house, and makes confiderable gains by buying and felling what he fpends in the house, and fuch a one is clearly not within the flatutes. But where persons buy goods, and make them up into faleable commodities, as thoemakers, fmiths, and the like; here, though part of the gain is by boddy labour, and not by buying and felling, yet they are within the statutes of bankrupts; for the labour is only in melioration of the commodity, and rendering it more fit for fale.

2. To learn what the all of bankrupter are which render a man a bankrupt, we must consult the several flatutes, and the refolutions formed by the courts thereon. Among these may therefore he reckoned, 1. Departing from the realm, whereby a man withdraws himself from the jurifdiction and coercion of the law, with an intent to defraud his creditors. 2. Departing from his own house, with intent to secreta himself and avoid his creditors. 3. Keeping in his own house, privately (except for just and necessary cause), so as not to be seen or spoken with by his creditors; which is likewife construed to be an intention to defraud his creditors, by avoiding the process of the law. 4. Procuring or suffering himself willingly to be grrefted, or outlawed, or imprifoned, without juit and lawful cause; which is likewise deemed an attempt to defraud his creditors. 5. Procuring his money, goods, chattels; and effects, to be attached or fequelitated by any legal process; which is another plain and direct endeavour to disappoint his creditors of their fecurity. 6. Making any fraudulent conveyance to a friend, or

⁽A) In Pegu, and the adjacent countries in East India, the creditor is entitled to dispose of the actor himfelf, and likewife of his wife and children: informuch, that he may even violate, with impunity, the challity of the debtor's wife; but then, by fo doing, the debt is underflood to be discharged.

Bankrupt, sceret trustee, of his lands, tenements, goods, or chat-Banks, tels; which is an act of the same suspicious nature with the laft. 7. Procuring any protection, not being himfelf privileged by parliament, in order to fereen his person from arrests; which also is an endeavour to elude the justice of the law. 8. Endeavouring, or defiring, by any petition to the king, or bill exhibited in any of the king's courts against any creditors, to compel them to take less than their just debts; or to procrastinate the time of payment, originally contracted for; which are an acknowledgment of either his poverty or his knavery. 9. Lying in prison for two months, or more, upon arrest or other detention for debt, without finding bail, in order to obtain his liberty. For the inability to procure bail argues a strong deficiency in his credit, owing either to his suspected poverty, or ill character; and his neglect to do it, if able, can aufe only from a fraudulent intention: in either of which cases, it is high time for his creditors to look to themselves, and compel a distribution of his effects. 10. Escaping from prison after an arrest for a just debt of roof, or upwards. For no man would break prison, that was able and defirous to procure bail; which brings it within the reason of the last case. 11. Neglecting to make fatisfaction for any just debt to the amount of tool, within two months after fervice of legal process, for such debt, upon any trader having privilege of parliament.

> These are the several acts of bankruptcy expressly defined by the flatutes relating to this article; which being fo numerous, and the whole law of bankrupts being an innovation on the common law, our courts of justice have been tender of extending or multiplying acts of bankruptcy by any construction or implication. And therefore Sir John Holt held, that a man's removing his goods privately to prevent their being feized in execution, was no act of bankruptcy. For the Hatutes mention only fraudulent gifts to third perfons, and procuring them to be feized by fham process, in order to defraud creditors: but this, though a palpable fraud, yet, falling within neither of those cases, cannot be adjudged an act of bankruptcy. So also it has been determined expressly, that a banker's stopping or reluling payment is no act of bankruptcy: for at is not within the description of any of the statutes; and there may be good reasons for his so doing, as fuspicion of forgery, and the like: and if, in confequence of fuch refufal, he is arrefted, and put in bail, itill it is no act of bankruptcy; but if he goes to prifon, and lies there two months, then, and not before, is he become a bankrupt.

> As to the confequences resulting from the unhappy fituation of a bankrupt, fee the article Commission of Bankruptcy.

BANKS (John), a dramatic writer, was bred to the law; and belonged to the fociety of Gray's Inn ; but this profession not suiting his natural disposition, he quitted it for the service of the Minses. Here, however, he found his rewards by no means adequate to his deferts. His emoluments at the best were precarious, and the various fuccesses of his pieces too feelingly convinced him of the error in his choice. This, however, did not prevent him from purfuing with cheerfulness the path he had taken; his thirst of fame, and warmth of poetic enthulialm, alleviating to

his imagination many difagreeable circumstances into Banks, which indigence, the too frequent attendant on poets- Banks's cal purfuns, frequently threw him. His turn was entirely to tragedy. His ment in which is of a peculiar kind. For at the fame time that his language must be confelled to be extremely unportical, and his numbeta uncouth and unharmonious; nay, even his characters very far from bem, flrougly marked or definguithed, and his epifodes extremely irregular: yet it is impossible to avoid being de ply affected at the reprefentation, and even at the reading, of his tragic This is owing in the general to a happy choice of his fully cts; which are all borrowed from hillory, either real or romantic; and indeed the motiof them from circumstances in the annals of our own country, which, not only from their being familiar to our continual recoli ction, but even from their having fome degree of relation to ourfelves, we are apt to receive with a kind of partial prepoficilion, and a predetermination to be pleafed. He has conffantly choicn as the bafis of his plays such tales as were in themselves and their well known catastrophes most truly adapted to the purposes of the drama. He has indeed but little varied from the strictness of historical tacts; yet he feems to have made it his constant rule to keep the scene perpetually alive, and never fuffer his characters to droop. His verse is not poetry, but profe run mad. Yet will the false gem sometimes approach so near in glitter to the true one, at least in the eyes of all but the real connoiffeurs (and how small a part of an audience are to be ranked in this class will need no ghoft to inform us), that bombast will frequently pals for the true sublime; and where it is rendered the vehicle of incidents in themselves affecting, and in which the beart is apt to interest itself, it will perhaps be found to have a stronger power on the human passions than even that property to which it is in reality no more than a bare succedaneum. And from these principles it is that we must account for Mr Banks's writings have. ing in the general drawn more tears from, and excited more terror in, even judicious audiences, than those of much more correct and more truly poetical authors. The tragedies he has left behind are, 1. Albion Queens.
2. Cyrus the Great. 3. Destruction of Troy. 4. Innocent Usurper. 5. Island Queens. This is only the Albion Queens altered. 6. Rival Kings. 7. Virtue Betrayed. 8. Unbappy Favourite. The Albion Queens was rejected by the managers in 1684; but was acted by: Queen Anne's command in 1706, with great applause, and has been several times revived. . The Unhappy Eavourite continued till very lately a flock. tragedy at the theatres; but gives way at fresent to: the latter tragedies from the fame flory, by Jones and. Brooke.—Neither the time of the both, nor that of the death, of this author, are afcertained. His remains, however, lie interred in the church of St. James's, Westminster.

BANKS's ISLAND, a fmall island in the South fea, discovered by Captain Cook in 1770, in S. Lat. 53. 32. W. Long. 186. 30. It is of a circular figure, and about 24 leagues in compais: it is fufficiently high to be feen at the distance of 12 or 15 leagues; and the land has a broken irregular furface, with the appearance of barrennefs rather than fertility. It is, however, inhabited; as some straggling savages were observed upon it.

BANKSIA.

Banksia Bann. BANKSIA, in botany; a genus of the monogynia order, belonging to the tetrandria class of plants. The amentum is fealy, the corolla counts of four petals; the anther a are in the cavity of the folds, and feffile; the capfule is bivalvular; and the feed is foltary, and bipartite. There are four species, the terrato, integrifolia, cride folia, and dentata, all natives of New Holland.

BANN, or BAN (from the Brit. ban, i. e. clamour), is a proclamation or public notice; any public fummons or edict, whereby a thing is commanded or forbidden. It is a word ordinary among the feudiffs: and there is both banus and banum, which fignify two feveral things .- The word lanns is particularly used in Lingland in publishing matrimonial contracts; which is done in the church before marriage, to the end that if any perion can speak against the intention of the parties, either in respect of kindred, precontract, or for other just cause, they may take their exception in triac, before the marriage is confummated; and in the canon law, Banna: funt proclamationes sponsi et sponse in ecclefiis furi folitæ. But there may be a faculty or license for the marriage, and then this ceremony is omitted: and ministers are not to celebrate matrimony between any perions without a license, except the banns have been first published three several times, upon pain of fuspension, &c. Can. 62.

The use of matrimonial banns is said to have been first introduced in the Gallican church, though something like it obtained even in the primitive times; and it is thus that Tertullian is supposed to mean by trinundina promulgatio. The council of Lateran sirst extended, and made the usage general. By the ordinance of Blois, no person could validly contract marriage, without a preceding proclamation of three banns; nor could any person whatever be dispensed with, except for the two last. But the French themselves have abated much of this severity; and only minors are now under an absolute necessity of submitting to the formality of banns. For majors, or those of age, after publication of the sirst banns, the two latter are easily bought off.

Bann is also used to denote proscription or banishment for a crime proved; because anciently published by sound of trumpet; or, as Vossius thinks, because those who did not appear at the above-mentioned summons, were punished by proscription. Hence, so put a prince under the lann of the empire, is to declare him divested of all his dignities. The fentence only denotes an interdict of all intercourse, and offices of humanity, with the offender; the form of which seems taken from that of the Romans, who banished persons by forbidding them the use of fire and water. Sometimes also, littles are put under the imperial bann; that is, stripped of their rights and privileges.

BANN also denotes a pecuniary mulet, or penalty, laid on a delinquent for offending against a bann.

BANN, or BANNUS, a title anciently given to the governor or viceroy of Croatia, Dalmatia, and Sclavonia.

Episcopal Bann, (Bannus Episcopalis), a mulét paid to the bishop by those guilty of facrolege and other crimes.

Bann is also used for a solemn anathema, or ex-

communication, attended with curfes, &c. In this Bann fense we read of papal banns, &c.

BANN, in military affairs, a proclamation made in the army by beat of drum, found of trumpet, &c. requiring the first observance of descipline, either for the declaring a new officer, or punishing an offender.

BANNER denotes either a fquare flag, or the

principal flandard belonging to a prince.

We find a multiplicity of opinions concerning the etymology of the word lanner; fome deriving it from the Latin landum, "a band or flag;" others from the word lann, "to fummon the vafial to appear in arms;" others again from the German lan, "a field or tenement," because landed men alone were allowed a banner: and, finally, there are some who think it is a corruption of panniere, from pannia, "cloth," because bunners were originally made of cloth.

The BANKER of France, was the largest and richest of all the flags borne by the ancient kings in their great military expeditions. St Martin's cap was in ofe 6.50 years as the banner of France; it was made of taffety, painted with the image of that faint, and laid one or two days on his tomb to prepare it for use. About the year 1100 came in a more pompous apparatu.. The banner royal was fallened to the top of a mail, or fome tall tree, planted on a feaffold, borne on a carriage drawn by oxen, covered with velvet houlings, decorated with devices or cyphers of the prince reigning, At the foot of the tree was a prieft, who faid mals carly every morning. Ten knights mounted guard on the fculfold night and day, and as many trumpets at the foot of the tree never ceased flourishing, to animate the troops. This cumbersome machine, the mode of which was brought from Italy, continued in use about 130 years. Its post was in the centre of the army. And here it was that the chief feats were performed, to carry off and defend the royal banner; for there was no victory without it, nor was any army reputed vanquished till they had loft this banner.

BANNERETS, an ancient order of knights, or feudal lords; who, possessing several large sees, led their vassals to hattle under their own flag or banner, when summoned thereto by the king. The word seems formed from banner, "a square slag;" or from band, which anciently denoted a slag.—Bannerets are also called in ancient writers milites vexilliferi, and vexillarii, bannerarii, bannarii, banderissii, &c.

Anciently there were two kinds of knights, great and little; the first whereof were called bannerets, the feeond backelors; the first composed the upper, the fecond the middle, nobility.

The banneret was a dignity allowed to march under his own flag, whereas the bachelorius eques followed that of another. To be qualified for a banneret, one must be a gentleman of family, and must have a power to raise a certain number of armed men, with estate enough to subsist at least 28 or 30 men. This must have been very considerable in those days; because each man, besides his servant, had two horsemen to wait on him armed, the one with a cross bow, the other with a bow and hatchet. As he was not allowed to be a baron who had not above 13 knights sees, so he was not admitted to be a banneret if he had less than 10.

Banneret, according to Spelman, was a middle or-Barneck. der between a baron and a fimple knight: called fometimes also vexillarius minor, to distinguish him from the greater, that is, from the baron, to whom alone properly belonged the jus vexilli, or privilege of the fquare flag. Hence the hanneret was also called bannerettus, quafi bare minor; a word frequently used by English writers in the fame fenfe as banneret was by the French, though neither of them occur before the time of Edward II.

> Some will have bannerets to have originally been persons who had some portion of a barony assigned them; and enjoyed it under the title of baro proximus, and that with the fame prerogatives as the baron him-Some, again, find the origin of bannerets in France, others in Brittany, others in England. Thefe lall attribute the inflitution of bannerets to Conan, licutenant of Maximus, who commanded the Roman le gions in England under the empire of Gratian in 383. This general, fay they, revolting, divided England into 40 centons, and in these cantons distributed 40 knights; to whom he gave a power of affembling, on occasion, under their feveral banners, as many of the effective men as were found in their respective districts: whence they are called bannerets. However this be, it appears from Froiffart, &c. that anciently fuch of the military tuen as were rich enough to raife and fublift a company of armed men, and had a right to do fo, were called lunnerels. Not, however, that these qualifications residered them knights, but only bannerets; the appellation of knight being only added thereto, because they were timple knights before.

> Pannerets were fecond to none but knights of the genter. They were reputed the next degree below the nobelity; and were allowed to bear arms with supporters, which none else may under the degree of a haron. In France, it is faid, the dignity was hereditry; but to England it died with the person that guned it. The order dwindled on the inflitution of b wonets by King James I. and at length became extinet. The last person created banneret was Sir John smath, made to after Edgehill light, for refcuing the Pendard of King Charles I.

> The form of the banneret's creation was this: On a day of battle, the candidate prefented his flag to the king or general; who, cutting off the train or fleirt thereof, and making it a fquare, returned it again, the proper banner of bannerets; who are hence fometimes called knights of the fquare flag. There feem to have been bannerets created either in a different manner, or by others than the fovereign; fince King James, in the patent of baronets, gives them precedence to all knights bannerets, except fuch as are created by the king himfelf in the field; which implies, either that there are some of this order created out of the field, or by inferior persons.

> BANNEKET is also the name of an officer or magifirste of Rome towards the close of the 14th century. -The people of that city, and throughout the territory of the church, during the disputes of the antipopes, had formed a kind of republican government; where the whole power was lodged in the hands of a magilirate sailed fenator, and twelve heads of quarters called bannerets, by reason of the banners which each raifed in his diffrict.

BANNOCK, a kind of oat cake, baked in the em-

bers, or on a stone placed before the fire. It is common Bannum in the northern parts of this kingdom.

BANNUM, in law, figuifies the utmost bounds of a Burtans. manor or town.

BANQUET, a feast or entertainment where people regale themselves with pleasant foods or fruits.

BANQUET, in the menage, that fmall part of the branch of a bridle that is under the eye; which being rounded like a small rod, gathers and joins the extremities of the bit to the branch, in such a manner that the banquet is not feen, but covered by the cope, or that part of the bit that is next the branch.

BANQUET Line, an imaginary line drawn, in making a bit, along the bunquet, and prolonged up or down, to adjust the defigned force or weakness of the branch, in order to make it fliff or eafy.

BANQUET, or Banquette, in fortification, a little foot-bank, or elevation of earth, forming a path which runs along the infide of a parapet, upon which the musketeers get up, in order to discover the counterfearp, or to fire on the enemy, in the most or in the covert way.

BANQUETING ROOM OF HOUSE. See SALDON. The ancient Romans supped in the atrium, or veltibule of their houses; but in after times, magnificent faloons, or banqueting rooms, were built, for the more commodious and splendid entertainment of their guells. Lucullus had feveral of thefe, each diffinguished by the name of fome god; and there was a particular rate of expence appropriated to each. Plutarch relates with what magnificence he entertained Cicero and Pompey, who went with delign to furprife him, by telling only a flave who waited, that the cloth should be laid in the Apollo. The emperor Clandius, among others, had a fplendid banqueting room named Mercury. But every thing of this kind was outdone by the luftre of that celebrated banqueting house of Nero, called domus aurea; which, by the circular motion of its partitions and ceilings, imitated the revolution of the heavens, and reprefented the different feafons of the year, which changed at every service, and showered down slowers, essences. and perfumes, on the guells.

BANSTICKLE, in ichthyology. See GASTERO-

BANTAM, a large town of the island of Java, in the East Indies, fituated in F. Long. 105. 16. S. Lat. 6. 20. It is the capital of a kingdom of the fame name, with a good harbour and fortified castle. It is divided into two towns separated by a river, and one of them inhabited by the Chinese. For its history, &c. lee JATA.

BANTAM-WORK, a kind of painted or carried work, refembling that of Japan, only more gaudy.

There are two forts of Bantam, as well as of Japan work. As, in the latter, some are flat, lying even with the black, and others high and emboffed; fo, in Bantam-work, some are flat, and others in-cut, or carved into the wood, as we find in many large fereens: with this difference, that the Japan artiffs work chiefly in gold and other metals; and those of Bantam generally in colours, with a fmall sprinkling of gold here and there: for the flat Bantam-work is done in colours, mixed with gum water, proper for the thing defigned to be imitated. For the carved, or in-cut kind, the method of performing it is thus deferibed by an inBaptifm.

genious artist: 1. The wood is to be primed with whiting and fize, fo often, till the primer lie near a quarter of an each thick; then it is to be water plained, i. e. rubbed with a fine wet cloth, and, fome time after, rubbed very smooth, the blacks laid on, varnished up with a good body, and polified well, though with a gentle hand. This done, the delign is to be traced out with vermilion and gum water, exactly in the manner wherein it is intended to be cut; the figures, trees, buildings, &c. in their due proportion: then the graver is applied, with other tools, of proper shapes, differing according to the workman's fancy: with thefe he cuts deep or fhallow, as is found convenient, but never deeper than the whiting lies, the wood being never to feel the edge of the instrument. Lines, or parts of the black, are still to be left for the draperies, and other outlines, and for the diffinction of one thing from another; the rule being to cut where the white is, and leave the black untouched. The carving bong finished, then take to the pencil, with which the colours are laid into the cut work : after this, the gold is to be laid on those places which the design requires; for which purpofe, a strong thick gum arabic water is taken and laid with a pencil on the work; and, while this remains wet, leaf gold is cut with a sharp smooth edged knife, in little pieces, shaped to the bigness and figure of the places where they are to be laid. Thefe being taken up with a little cotton, they daub them with the same close to the gum water, which affords a rich luftre. The work thus finished, they clear up the black with oil, taking care not to touch the colours. The European workmen ordinarily use brass dust, which is less bright and beautiful.

BANTRY, a town of Ireland, in the county of Cork, and province of Muniter. It is scated on a bay of the same name, in W. Long. 9. 15. N. Lat. 51. 30.

BAOBAB, the name given by Prosper Alpinus to the African calabash tree, since called Adamsonia. See that article.

BAPTISM, in matters of religion, the ceremony of washing; or a facrament, by which a person is initiated into the Christian church .- The word is formed from the Greek Burlige, of Burla to dip, or wash. Baptilm is known, in ecclefialtical writers, by divers other names and titles. Sometimes it is called palingenefia, or lawer of generation; formetimes falus, or life and falvation; formetimes opeanus, figuarulum Domini, and fignaculum fidei, or the feal of faith; fometimes absolutely mysterium, and sucramentum; sometimes the facrament of, faith; fometimes viaticum, from its being administered to departing persons; sometimes sacerdo-Implem's tium laid, or the lay priefthood, because allowed, in cases '78 End of necessity, to be conferred by laymen: fometimes it is called the great circumcifion, because it was imagined to faceced in the room of circumcifion, and to be a feal of the Christian covenant, as that was the feal of the coveneut made with Abraham: fo, in regardthat be ptismhad Christ forits author, and not man, it was anciently known by the name of Augor and Ragiona Kogni, the gift of the Lord: fometimes it was simply called dugger, without any other addition, by way of enumence, because it was both a gratuitous and fingular gaft of Christ: in reference to the making men complete members of Christ's body, the church, it had the name of Textures, and Texus, the confectation, and confimmation; because it

gave men the perfection of Christians, and a right to Baptilin. partake of the To Tixuos, which was the Lord's Supper : H had also the name of purous and puraywyin, the initintion, because it was the admittance of men to all the facred rites and mysteries of the Christian religion.

Baptism has been supposed by many learned authors Its origin, to have had its origin from the Jewish church, in &c. which, as they maintain, it was the practice long before Christ's time, to haptize proselytes or converts to their faith, as part of the ceremony of their admission; a practice which, according to fome, obtains among them to this day; a person turning Jew, is first circumcifed, and, when healed, is bathed, or baptized in water, in presence of their rabbins; after which he is reputed a good Jew. Others, however, infift that the Jewish proselyte haptism is not by far so ancient, and that John the Baptist was the first administrator of baptifm among the Jews. Of this opinion were Deylingius, J. G. Carpzovius, Boernerus, Werntdorfins, Zeltnerus, Owen, Knatchbull, Jennings, Gill, and

Grotius is of opinion, that the rite of baptifm had its original from the time of the deluge; immediately after which, he thinks, it was inflituted in memory of the world having been purged by water. Some learned men think it was added to circumcifion, foon after the Samaritan schism, as a mark of distinction to the orthodox Iews. Spencer, who is fond of deriving the rites of the Jewith religion from the ceremonies of the Pagans, lays it down as a probable supposition, that the Jews received the haptifm of profelytes from the neighbouring nations, who were wont to prepare candidate. for the more facted functions of their religion, by a folemn abolution; that, by this affinity of facred rites, they might draw the Gentiles to embrace their religion, and that the profelytes (in gaining of whom they were extremely diligent) might the more rably comply with the transition from Gentilism to Judaism. In confirmtion of this opinion, he observes, first, that there is no divine precept for the baptifin of profelytes, God having enjoined only the rite of encumerism for the admission of strangers into the Jawish religion. Secondly, That, among foreign nations, the Egyptane, Perfians, Greeks, Romans, and others, it was cost analythat those who were to be initiated into their mytherics, or sacred rites, should be first purified by dipping their whole body in water. That learned writer adds, as a farther confirmation of his opinion, that the cup of blefing likewife, added to the paschal support, seems plainly to have been derived from a Pagan original; for the Greeks, at their feaths, had one cup called rorreits ayada dasperoe, the cup of the good damon or god, which they drank at the conclusion of their entertainment, when the table was removed. Since then, a rate of Gentile origin was added to one of the Jewith factaments, viz. the paffover, there can be no abfurdity in supposing, that baptism, which was added to the other facrament, namely circumcifion, might be derived from the fame fource. In the last place, he observes, That Christ, in the inflitution of his facraments, paid a pecallar regard to those rites which were borrowed from the Gertiles: for, rejecting circumcifion and the patchal tupper, he adopted into his religion baptifm and the harred cup; thus preparing the way for the conversion and reception of the Gentiles into his church.

The

The defign of the Jewish baptism, if baptism be

practifed by them, is supposed to be, to import a rege-

neration, whereby the profelyte is rendered a new man,

and of a flave becomes free. The effect of it is to cancel

all former relations; to that those who were before akin

to the person, after the ceremony ceased to be so. It is to

this ceremony Christ is supposed to have alluded, in his expression to Nicodemus, that it was necessary he should

Baptilm.

be born again, in order to become his disciple.—The necessity of baptism to falvation, is grounded on those two fayings of our Saviour: He that believeth, and is baptized, Shall le faved; and, Except a man be lorn of Opinions water and of the Spirit, he cannot enter into the king-concerning dom of God.—The ancients did not generally think the mere want of baptism, where the procuring it was imcy or bap-chin to fal- practicable, excluded men abfolutely from the hopes of cternal falvation. Some few of them, indeed, are pretvation. ty severe upon infants dying without baptism; and some others feem also, in general terms, to deny eternal life to adult persons dying without it: but when they interpret themselves, and speak more distinctly, they make fame allowances, and except feveral cafes, in which the want of baptifin may be supplied by other means. Such are, martyrdom, which commonly goes by the name of fecond baptism in men's own blood, in the writings of the ancients; because of the power and efficacy it was thought to have to fave men by the inviable haptism of the Spirit, without the external element of water. Faith, and repentance, were also efleemed a supplement to the want of baptism, in such extechances as died while they were proufly preparing themselves for baptism. Constantly communicating

Of the time, baptifin.

his parents, but of the minister, or where any unavoidable accident rendered baptifm absolutely impossible, Hinemar, and others, make an exception, in holding the child faved without baptism. The receiving baptism is not limited to any time, or place and age of life. Some contended for its being administerlubject of ed like circumcilion, precifely on the eighth day, as Greg. Nazianzen; and others would have it deferred till the child is three years of age, and able to hear the myttic words, and make answer thereto, though they do not understand them. In the con law we find divers injunctions against deferring the baptism of infants beyond the 37th day, 30th day, and the 9th day; some of them under pecuniary forfeitures.

with the church, was thought to supply the want of baptifm, in perfons who had been admitted to com-

munion, on a profumption of their being duly bap-

tized, though the contrary afterwards appeared. For infants dying without baptifm, the cafe was thought

more dangerous; as here, no perforal faith, repentance,

or the like, could be pleaded, to supply the defect, and

wath away original fin: on this account, they who

spoke most favourably of them, as Greg. Nazianzen, and Severus billiop of Antioch, only affigned them a

middle flate, neither in heaven nor hell. But the La-

tins, as St Augustin, Fulgentius, Marius Mercator, &c.

who never received the opinion of a middle flate, con-

cluded, as they could not be received into heaven, they

must go to hell. Pelagius, and his followers, who

denied original fin, affected, that they might be admitted to eternal life and falvation, though not to the

kingdom of heaven; between which they distinguished. Where the fault was not on the fide of the child, nor

Salmasius, and Suicerus from him, deliver it as Baptism. authentic hillory, that for the two first ages, no one received baptifm, who was not first instructed in the faith and doctrine of Christ, so as to be able to anfwer for himfelf, that he believed; because of those words, He that believeth, and is baptized; which, in effect, is to fay, that no infant, for the first two ages, was ever admitted to Christian baptism. But afterwards, they own, that pado haptilin came in, upon the opinion that baptilm was accessary to falvariou. But Voffius, Dr Forbes, Dr Hammond, Mr Walker. and especially Mr Wall, who has exactly considered the testimony and authority of almost every ancient writer that has faid any thing upon this subject, endeavour to evince, that infants were baptized even in the apostolical age. It is certain, Tertullian pleads ftrongly against giving baptifin to infants; which shows, at leaft, that there was fome fuch practice in his age, though he disapproved of it. It is certain, the ordinary fubjects of this facrament, in the first ages, were converts from Judaism and Gentilism, who before they could be admitted to baptifm, were obliged to spend fome time in the flate of catechumens, to qualify them to make their professions of faith, and a Christian life, in their own persons: for, without such personal professions, there was ordinarily no admission of them to the privilege of baptism. Those baptized in their fick-beds were called clinici; and were held in some reproach, as not being reputed true Christians. Hence feveral confures, in councils and ecclefiaftical writers, of clinic baptism. This clinic baptism was not sufficient to qualify the person, in case of recovery, for ordination. Some had their baptism put off by way of punishment, when they fell into gross and scandalous crimes, which were to be expiated by a longer course of discipline and repentance. This was sometimes 5, 10, 20 years, or more; even all their lives to the hour of death, when their crimes were very flagrant.

In the earliest ages of the church, there was no stated time or place for the reception of baptism. Afterwards Easter, Whitsuntide, and Epiphany, became folemn feafons, out of which baptifm was not administered, except in cases of necessity. The catechumens, who were to receive it at these times, were called competentes: and to these it is that St Cyril addresses his catechefes. In the apostolical age, and some time after, before churches and baptisteries were generally crected, they baptized in any place where they had convenience; as John baptized in Jordan, and Philip baptized the cunuch in the wilderness, and Paul the jailor in his own house. But in after ages, baptisteries were built adjoining to the church : and then rules were made, that baptism should ordinarily be adminiftered nowhere but in these buildings. Justinian, in one of his novels, refers to ancient laws, appointing that none of the facred mysteries of the church should be celebrated in private houses. Men might have private oratories for prayer in their own houses; but they were not to administer baptism or the cucharit in them, unless by a particular license from the bishop of the place. Such baptifms are frequently condemned in the ancient councils, under the name παραβαπτισματα, baptifms in private conventicles.

As to the attendant ceremonies and manner of bap-Ancient tifm in the ancient church: The person to be baptized, ceremonic Eaptifm if an adult, was first examined by the bishop or officiating prieft, who put fome quellions to him; as, first, Whether he abjured the devil and all his work; fecoudly, Whetlier he gave a firm affent to all the articles of the Christian faith: to both which he answered in the affirmative. If the person to be baptized was an infant, these interrogatories were answered by his fronfores, or godfathers. Whether the ute of spoofers was as old as the apostles days, is mecetan: primps it was not, fince Jailor Mutyr, speaking of the method and form of baptilm, figs not a word or them.-After the question can bridgers, follow devoreifin; the manner and end of which was dust. The mounter laid his hands on the palon's bead, and breathed in his face, implying thereby the driving away or expelling of the dol from him, and propring him for buptiling by which the good and buly fpilt was to be conterred upon him .- After exceed i, fell and haptifu itfelf: and first the minuter, by prayer, confectated the water for that use. Testullian favs, " Any waters may be "applied to that use: but then God must be first in-" vocated; and then the Holy Ghost presently comes "down from heaven, and moves upon them, and fanc-" tilies them." The water being confecrated, the perfon was baptized " in the name of the Father, and of " the Son, and of the Holy Ghost;" by which " de-" dication of him to the bleffed Trinity, the person " (fays Clemens Alexandrinus) is delivered from the " corrupt trinity, the devil, the world, and the flesh." In performing the ceremony of baptilin, the usual custom (except in clinical cases, or where there was scarcity of water) was to immerse and dip the whole body. Thus St Barnabas, describing a baptized perfon, fays, " We go down into the water full of fin " and filth, but we afcend bearing fruit in our hearts." And this practice of immersing the whole body was so general, that we find no exceptions made in respect either to the tenderness of infants, or the bashfulness of the other fex, unless in case of sickness or other disability. But to prevent any indecency, men and women were haptized apart. To which end, either the baptisteries were divided into two apartments, one for the men, the other for the women, as Bingham has obferved; or the men were baptized at one time, and the women at another, as is shown by Vossius, from the Ordo Romanus, Gregory's Sacramentarium, &c. Add, that there was anciently an order of deaconesses, one part of whole buliness was to affift at the baptism of women. These precautions, however, rather judicate a. forupulous attention to delicacy, than imply any indecency in the circumstance of immersion itself. From the candidates being immerfed, there is at least no reafon to infer that they were naked: The present Baptiffs never baptize naked, though they always immerfe. After immersion, followed the unction; by which (fays St Cyril) was fignified that they were now cut off from the wild olive, and were ingrafted into Christ, the true olive tree; or elfe to show that they were now to be champions for the gospel, and were anointed thereto, as the old athlets were against their folemn games. With this anointing was joined the fign of the cross, made upon the forch ad of the person baptized; which being done, he had a white garment given him, to denote his being washed from the defilements of fin, or in allusion to that of the apostic, " as many as are " baptized in Christ have put on Christ." From this

cultom the feast of Pentecost, which was one of the Baptism. annual featons of baptifm, came to be called Whitfunday, i. c. White-funday. This garment was afterwards laid up in the church, that it might be an evidence against fuch perfons as violated or denied that faith which they had owned in baptism .- When the baptism was performed, the p rion baptized, according to Justin Marty, was ree leed into the number of the faithful, " who the cent up their public prayers to God, for " all men, for themisives, and for those who had been " Laptized."

The ordinary ministers, who had the right of a lminutering this facrament, that is, of applying the water to the body, and pronouncing the formula, were prefbyters or bishops; though on extraordinary occafions, laymen were admitted to perform the fame.

fathers, whether they promife, in the child's name, to

live and die in the true catholic and apostolic faith, and

what name they would give the child. Then follows

an exhortation to the sponfors; after which the prioti,

calling the child by its name, after it as follows: IF hat dost thou demand of the church? The godfather answers, Eternal life. The pricit goes on: If you are de-

firous of obtaining eternal life, keep God's commandments,

thou shalt love the Lord thy God, &c. After which he

breathes three times in the child's face, faying, Come

out of this child, thou evil fpirit, and make room for the Holy Ghoft. This faid, he makes the fign of the crofs

on the child's forehead and breaft, faying, Precioe the fign of the cross on thy forchead, and in thy heart. Then

taking off his cap, he repeats a fhort prayer; and laying

his hand gently on the child's head, repeats a fecond prayer: which ended, he bloffes fome falt; and putting

a little of it into the child's mouth, pronounces thefe

words, Receive the falt of wifdom. All this is performed at the church door. The pricit, with the god.

fathers and godmothers, coming into the church, and advancing towards the font, repeat the apostles creed

and the Lord's prayer. Being come to the font, the

priest exorcifes the evil spirit again; and taking a little of his own spittle, with the thumb of his right hand,

rubs it on the child's cars and nostrils, repeating as he

touches the right ear, the same word (Ephatha, 'e thou opened) which our Saviour made afe of to the man born

deaf and dumb. Laftly, They pull off its fwaldling clothes, or strip it below the shoulders, during which

the priest prepares the oils, &c. The sponsors then hold the child directly over the font, observing to turn

it due east and west: whereupon the priest asks the

child. Whether Le renounces the devil and all his works?

and the godfather having answered in the assimultive,

the priest amoints the child between the shoulders in the form of a cross. Then taking some of the consecrated

water, he pours part of it thrice on the child's head,

at each perfusion calling on one of the persons of the Holy Trinity. The priest concludes the ceremony of

buptifm with an exhortation .- The Romift church allows andwives, in cases of danger, to baptize a child

before it comes entirely out of its mother's womb :

where it is to be observed, that some part of the body;

As to the prefent form of administering baptism, Modern the church of Rome uses the following: When aloras in the child is to be baptized, the perfons who bring it hurch of wait for the priest at the door of the church, who Rome. comes thither in his furplice and purple flole, attended by his clerks. He begins with queltioning the godLa the

Greek

church.

English

liturgy of

of the child must appear before it can be baptized, and that it is baptized on the part which first appears: if it by the head, it is not necessary to repartize the child: but if only a foot or hand appears, it is necessary to repeat baptifin. A still-born child, thus baptized, may be buried in confecrated ground.

The Greek church differs from the Romish, as to the rite of baptism, chiefly, in performing it by immersion,

or plunging the infant all over in the water.

The forms of administering baptism among us being form in the too well known to require a particular description, we K. Edward flall only mention one or two of the more material dif-ferences between the form, as it flood in the first liturgy of King Edward, and that in the English Common Prayer Book at prefent. First, 'The form of confectating the water did not make a part of the office, in King Edward's liturgy, as it does in the prefent, I cause the water in the font was changed, and confecrited, but once a month. The form likewife itself was formething different from that now used; and was introduced with a short prayer, that Jefus Christ, upon whom (when he was buptized) the Holy Ghost came down in the likeness of a dove, would fend down the same Holy Spirit, to fanctify the fountain of haptifm; which prayer was afterwards left out, at the second review .- By King Edward's first book, the minister is to dip the child in the water thrice; first, dipping the right fide; It ondly, the left; the third time, dipping the face toward the font. This trine immersion was a very ancient practice in the Christian church, and used in honour of the Hely Trinity; though fome later writers fiv, it was done to reprefent the death, burial, and refaire clion, of Christ, together with his three days continuance in the grave. Afterwards, the Arians making an ill use of it, by perfuading the people that it was used to denote that the three Persons in the Trimty were three diffine fubftances, the orthodox left it off, and used only one fingle immersion.

By the first common prayer of King Edward, after the child was baptized, the godfathers and godmothers were to lay their hands upon it, and the minister was to put on him the white veilment commonly called the chryfome, and to fay, " Take this white vesture, as a token of the innocency, which, by God's grace, in this holy facrament of baptism, is given unto thee; and for a fign, whereby thou art admonified, fo long as thou livell, to give thyfelf to innocence of living, that after this transitory life thou mayest be partaker of the life everlathing. Amen." As foon as he had prononneed these words, he was to anoint the infant on the head, faying, " Almighty God, the father of our Lord Jefus Chrift, who hath regenerated thee by water and the Holy Ghost, and hath given unto thee remission of all thy fine; may be vouchsafe to anoint thee with the unction of his Holy Spirit, and bring thee to the inheritance of everlasting life. Amen. This manifestly done in imitation of the practice of the

mitive church.

The custom of sprinkling children, instead of dipping them in the font, which at first was allowed in case of the weakness or sickness of the infant, has so far prevailed, that immersion is at length quite excluded. What principally tended to confirm the practice of affulion or fprinkling, was, that feared of our Proteftant divines, flying into German Switzerland

during the bloody reign of Queen Mary, and returning Baptiful home when Queen Elizabeth came to the crown, brought back with them a great zeal for the Protestant churches beyond fea, where they had been sheltered and received; and having observed, that at Geneva and fome other places, baptilm was administered by sprinkling they thought they could not do the church of England a greater piece of service than by introducing a practice dictated by fo great an oracle as Calvin. This, together with the coldness of our northern climate, was what contributed to banish entirely the practice of dipping infants in the font.

Many different notions have been entertained con-Notions cerning the effects of baptifm, which it would be end-concerna less to enumerate. The Remonstrants and Sociolans the offers reduce baptism to a mere sign of divine grace. The of baptist Romanists, on the contrary, exalt its power; holding, that all fin is entirely taken away by it; that it abiolutely confers the grace of justification, and confequently grace ex opere operato. Some also speak of an indelible character impressed on the soul by it, called character dominicus, and character regius : but this is held, by others, a mere chimera; for that the spiritual character, conferred in regeneration, may eafily be effaced by mortal fins. Dodwell maintained, that it is by baptism the foul is made immortal; fo that those who die without it will not rife again. It must be added, he restrains this effect to episcopal haptism alone. From the effects ordinarily ascribed to haptifin, even by ancient writers, it should feem, that the ceremony is as much of heathen as Jewish origin; fince Christians do not restrain the use of it, like the Jews, to the admission of new members into the church, but hold, with the heathens, a virtue in it for remitting and washing away fins. The Bramins are still faid to baptize with this latter view, at certain scafons, in the river Ganges; to the waters whereof they have annexed a cleanfing or fanctifying quality; and hence it is that they flock from all parts, even of Tartary, driven by the expectation of their being eafed of their load of fins. But, in this point, many Christians seem to have gone beyond the folly of the heathens. It was only the smaller fins of infirmity which these latter held to be expiable by washing; for crimes of a blacker dye, they allowed no water could efface them, no purgation could discharge them. The Chriflian doctrine of a total remission of fins by baptisat could not fail, therefore, to fcandalize many among the heathens, and furnished Julian an occasion of satirizing Christianity itself: "Whoever (fays he) is guilty of rapes, murders, facrilege, or any abominable crime, let him be washed with water, and he will become pure and holy."

In the ancient church, baptifin was frequently conferred on Jews by violence; but the church itself never feems to have allowed of force on this occasion. By a canon of the fourth council of Toledo, it is expressly forbid to baptize any against their wills. That which looks most like force in this case, allowed by law, were two orders of Justinian; one of which appoints the heathens, and the other Samaritans, to be baptized, with their wives, children and fervants, under pain of confication. By the ancient laws, bap. tifm was not to be conferred on to see makers, flage. players, gladiators, auriga or public dravers, magi-

Baptilm. cians, or even firolling beggars, till they quitted fuch professions. Slaves were not allowed the privilege of baptifm without the tellimony and confent of their mafters; excepting the flaves of Jews, Heathens, and 1. in. c. 5 beretics; who were not only admitted to baptim, but, c. 11. § 17, in confequence thereof, had their freedom. Vollius has a Larned and elaborate work De Bapti/ma, wherein he accurately diffculf a all the questions concerning baptism according to the doctime of the ancients.

BALLIAN by Fire, spoken of by St John the Baptill, has occasioned much conjecture. The generality of the fathers held, that believers, before they enter paradife, are to pais through a certain fire, which is to purify them from all pollutions remaining on them unexpiated. Others, with St Bald, understand it of the fire of hell; others, of that of tribulation and temptation. Others, with St Chryfostom, will have it denote an abundance of graces. Others suppose it to mean the defect of the Holy Choft on the apolities, in form of hery tongues. Lattly, Others maintain, that the word fire here is an interpolation; and that we are only to read the text, ile that shall come after me will baptize you with the Holy Ghoft. In reality, it is not found in divers manufcript copies of St Matthew.

The ancient Selucians and Hormians, understanding the passage literally, maintained, that material fire was necessary in the administration of baptism. But we do not find how or to what part of the body they applied it, or whether they were fatisfied with obliging the person baptized to pass through the fire. Valentinus rehaptized all who had received water baptifm, and conferred on them the baptism of fire.

Bis decuit tingi, traductoque corpore flamma. T'ertull. Carm. Contr. Marc. 1. 1.

Heracleon, cited by Clemens Alexandrinus, fays, that fome applied a red hot iron to the ears of the perfon baptized, as if to imprefs fome mark upon him.

BAPTISM of the Dead, a custom which anciently prevailed among fome people in Africa, of giving baptism to the dead. The third council of Carthage speaks of it as a thing that ignorant Christians were fond of. Gregory Nazianzen also takes notice of the same superactions opinion prevailing among some who delayed to be baptized. In his address to this kind of men, he asks, whether they stayed to be baptized after death? Philastrius also notes it as the general error of the Montanists or Cataphrygians, that they baptized men after death. The practice feems to be grounded on a vain opinion, that, when men had neglected to receive baptilm in their lifetime, some compensation might be made for this default by receiving it after death.

Buptifm of the Dead was also a fort of vicarious baptilm, formerly in Ofe, when a person dying without

baptism, another was baptized in his stead.

St Chrysostom tells us, this was practifed among the Marcionites with a great deal of ridiculous ceremony; which he thus describes: After any catechumen was dead, they hid a living man under the bed of the deceased; then coming to the dead man, they asked him, whether he would receive baptism; and he making no answer, the other answered for him, and faid, he would be baptized in his flead: and fo they baptized the living for the dead.

Epiphanius affures us, the like was also practifed a-Vol. II. Part II.

mong the Corinthians. This practice they pretended Bigilin. to found on the apolile's authority; alleging that text of St Paul for it, If the dead rife not at all, what shall they do who are haptized for the dead? A text which has given occasion to a great variety of different tyllems and explications. Bosius enumerates no less than mine different opinions among learned divines concerning the fense of the phrase being baptized for the dead.

St Ambrole and Walafred Strabo fcem clearly of opinion, that the apostle had respect to such a custom then in being ; and feveral moderns have given into the fame opinion, as Baronius, Jos. Scaliger, Justellus,

and Grouns.

Several among the Roman Catholies, as Bellarnia, Salmeron, Menochins, and a number of fetroolinen, understand it of the baptilm of tears, and penance, and prayers, which the living undergo for the dead; and thus allege it as a proof of the belief of purgatory in St Paul's days.

Hypothetical Bartism, that formerly administered in certain doubtful cales, with this formula: If the undit baptized, I do not rebaptize; if thou art not, I t. fire thee in the name of the Futher, &c. This fort of baptism, enjoined by some ancient constitutions of the

English church, is now fallen into dilufe.

Solemn BAPTISM, that conferred at flated feafon; fuch, in the ancient church, were the Pafford buff fin, and that at Whitfuntide. This is fometimes also called

general haptifm.

Lay BAPTISM, we find to have been primitted 1. both the Common Prayer Books of King Edward and that of Queen Elizabeth, when an infant is in immidiate danger of death, and a lawful minuter cannot be had. This was founded upon the multiplier rotion of the impolibility of falvation without the faciament of baptism: but afterward, when they came to have clearer notions of the facraments, it was un unmoodly refolved in a convocation, held in the year 1575, that even private baptism, in a case of necessary, was only to be administered by a lawful minister.

BAPTISM is also applied, abusively, to certain ceremonies used in giving names to things matemate.

The ancients knew nothing of the culton of giving baptism to manimate things, as bells, ships, and the like, by a superflitious confeccation of them. The field notice we have of this is in the Capitulars of Charles the Great, where it is only mentioned to be confured: but, afterwards, it crept into the Roman offices by degrees. Baronus carries us antiquity no higher than the year 968, when the greatest bell of the church of Lateran was christened by Pope John III. At last it grew to that superstitious height, as to be thought proper to be complained of in the Centum Gravanina of the German nation, drawn up in the public diet of the empire held at Nuremberg anno 1581; where (after having deferibed the ceremony of baptizing a bell, with godfathers, who make responses as in baptism, and give it a name, and clothe it with a new garment as Christians were used to be clothed, and all this to make it capable of driving away tempelts and devils) they conclude against it, as not only a superstitious practice, but contrary to the Christian religion, and a mere ieduction of the simple people.

BAPTISM, in the Ica language, a ceremony in long voyages on board merchant thips, practifed both on

5 H persona. Baptismal persons and vessels who pass the tropic or line for the Baptits. The baptizing of the veffels is simple, and confils only in washing them throughout with feawater; that of the paffengers is more mysterious. The olded of the crew, that has past the tropic or line, comes with his face blacked, a grotefque cap on his head, and fome fea book in his hand, followed by the rest of the seamen dressed like himself, each having · fome kitchen utenfil in his hand, with drums beating ; he places himself on a feat on the deck, at the foot of the main mast. At the tribunal of this mock magifirate, each passenger not yet initiated, swears he will take care the fame ceremony be observed, whenever he is in the like circumstances: Then, by giving a little money by way of gratification, he is discharged with a little sprinkling of water; otherwise he is heartily drenched with threams of water poured upon him; and the thip boys are enclosed in a cage, and ducked at difcretion.-The feamen on the baptizing a ship, pretend to a right of cutting off the beak-head unless redeemed by the captain.

> BAPTISMAL, fomething belonging to baptifm; thus we say baptismal vow, presents, &c.

> BAPTISMAL Vow or Covenant a profession of obedience to the laws of Christ, which persons in the ancient church made before baptism. It was an indifpenfable part of the obligation on catechumens, before they were admitted to the ceremony of regeneration. It was made by turning to the east; for what mystical reasons, is not well agreed on.

> BAPTISMAL Prefents are in use in Germany, made by the sponsors to the infant, confisting of money, plate, or even fometimes fiefs of lands; which by the laws of the country are to be kept for the child till of age, the parents having only the truft, not the right, of disposing of them. An anonymous author has published a discourse express on this occasion, entitled, De

> premia luffrica. BAPTIST (John), Monnoyer, a painter of flowers and fruit, was born at Lifle in 1635, and educated at Antwerp, where he perfected himself in the knowledge of his art, and in his first years was intended for a printer of history: but having foon observed that his genius more strongly inclined him to the painting of flowers, he applied his talents to those subjects, and in that style became one of the greatest masters. His pictures are not fo exquifitely finished as those of Van Huyfum, but his composition and colouring are in a holder style. His flowers have generally a remarkable freedom and loofeness, as well in the disposition as in penciling; together with a tone of colouring that is lively, admirable, and nature itself. The disposition of his objects is surprisingly elegant and beautiful; and in that respect his compositions are easily known, and as eafily diffinguished from the performances of others. He died in 1600.—He left a fon, Anthony, who painted flowers in the fame tiyle and manner, and had great merit.

BAPTISTS, in ecclefiaffical history, (from Beatiles, Applize); a denomination of Christians, distinguished from other Christians by their particular opinions rein the mode and the subjects of baptism.

allead of administering the ordinance by sprinkling uring water, they maintain that it ought to be histered only by immersion. Such, they insist, is

the meaning of the word Banligu; fo that a command Bartifle to baptize is a command to immerfe. Thus it was understood by those who first administered it. John the Baptist, and the apostles of Christ, administered it in Jordan and other rivers and places where there was much water. Both the adminishators and the subjects are deferibed as going down into, and coming up again out of, the water; and the baptized are faid to be buried in baptifin, and to be raifed again: which language could not, they fay, be properly adopted on Supposition of the ordinance being administered in any other manner than by immersion. Thus also, they affirm, it was in general administered in the primitive church. Thus it is now administered in the Russian and Greek church: and thus it is, at this day, directed to be administered in the church of England, to all who are thought capable of fubmitting to it in this manner. With regard to the subjects of baptism, the Baptifts fay, that this ordinance ought not to be adminiflered to children or infants at all, nor to grown up persons in general; but to adults only of a certain character and description. Our Saviour's commission to his apostles, by which Christian baptism was instituted, is to go and teach all nations, baptizing them: that is, fay they, not to baptize all they meet with; but first to instruct them—to teach all nations, or to preach the gospel to every creature-and whoever receives it, him to baptize in the name of the Father, and of the Son, and of the Holy Ghost. To such persons, and to such only, baptism appears to have been administered by the apostles and the immediate disciples of Christ. They are described as repenting of their fins, as believing in Christ, and as having gladly received the word. Without these qualifications, Peter acquaints those who were converted by his fermon, that he could not have admitted them to baptism. Philip holds the same language in his discourse with the eunuch; and Paul treats Lydia, the jailor, and others, in the fame manner. Without these qualifications, Christians in general think it wrong to admit persons to the Lord's supper; and, for the same reafons, without these qualifications, at least a profession of them, the Baptists think it wrong to admit any to baptism. Wherefore they withhold it, not only from the impenitently vicious and profane, and from infidels who have no faith; but also from infants and children, who have no knowledge, and are incapable of every action civil and religious. They further infift, that all politive inflitutions depend entirely upon the will and declaration of the institutor; and therefore, that reasoning by analogy from abrogated Jewish rites is to be rejected, and the express commands of Christ refpecting the mode and subjects of baptism ought to be our only rule.

The Baptists in England form one of the denominations of Protestant diffenters. They separate from the establishment for the same reasons as their brethren of the other denominations do; and from additional motives derived from their particular tenets respecting baptilm. The constitution of their churches, and their modes of worship, are congregational or independent: in the exercise of which they are protected, in common with other diffenters, by the act of toleration. Before this act, they were liable to pains and penalties as nonconformists, and often for their peculiar fenti-

Baptifts, ments as Baptifts. A proclamation was iffued out Baptifery against them, and some of them were burnt in Smithfield in 1538. They bore a confiderable share in the perfecutions of the last and of the preceding centuries; and, as it should seem, in those of some centuries before; for there were several among the Lollards and the followers of Wickliff, who disapproved of infant baptifm. There were many of this perfuation among the Protestants and reformers abroad. In Holland, Germany, and the North, they went by the names of ANA-BAPTISTS, and MENNONITES; and, in Piedmont and the South, they were found among the Albigrases and WALDENSES. See the histories of the Reformation, and the above articles in this Dictionary.

The Baptifle fubfilt under two denominations, viz. the Particular or Calvimflical, and the General or Arminian. The former are by far the most numerous. Some of both denominations allow of mixed communion, viz. of persons who have been sprinkled in their infancy, and therefore unbaptized in the view of the Baptiffs; others difallow it; and fome of them obferve the feventh day of the week as the fabbath, apprehending the law that enjoined it not to have been repealed by Christ or his apostles. But a difference of opinion respecting these and other matters, is not peculiar to the Baptiffs: it is common to all Christians, and to all bodies of men who think and judge for them-

BAPTISTERY, in ecclefialtical writers, a place in which the ceremony of baptism is performed.

In the ancient church it was one of the exedex or buildings diffinet from the church itself: and confifted of a porch or anti-room where the persons to be baptized made their confession of faith, and an inner room where the ceremony of baptifin was performed. Thus it continued till the fixth century, when the baptisteries began to be taken into the church porch, and afterwards into the church itself.

The ancient baptisteries were commonly called polirngia, photisteria, q. d. places of illumination; an appellation sometimes given to baptism. Or they might have the name for another reason, because they were the places of an illumination, or instruction, preceding baptism : for here the catechumens seem to have been trained up, and instructed in the first rudiments of the Christian faith.

Those baptisteries were anciently very capacious; because, as Dr Cave observes, the stated times of baptilm returning but feldom, there were usually great multitudes to be baptized at the same time; and then the manner of baptizing, by immersion, or dipping under water, made it necessary to have a large font likewise. In Venantius Fortunatus, it is called aula baptismatis, the large hall of baptism; which was indeed to capacious, that we fometimes read of councils meeting and fitting therein. This hall, or chapel, was always kept thut during Lent, and the door fealed up with the bishop's scal, not to be opened till Maunday

The baptistery was always reputed a facred place. In the Roman order, we find the ceremonies used in the confecration of the baptisteries: they were to be built of a round figure, and distinguished with the image of St John the Baptist; over the bason or sont was a figure of a dove in gold or filver, to represent the Bar. Holy Ghoft.

The name baptistery is fometimes also given to a kind of chapel in a large church, which ferved for the fame office. It is an observation of some learned men, that anciently there was but one baptistery in a city, and that at the bishop's church; and that afterwards they were fet up in parish churches, with the special allowance however of the bishop.

BAR, in a general fense, denotes a slender piece of wood or iron, for keeping things close together.

BAR, in courts of justice, an enclosure made with a flrong partition of timber, where the council are placed to plead causes. It is also applied to the benches where the lawyers or advocates are feated, because anciently there was a bar to feparate the pleaders from the attorneys and others. Hence our lawyers who are called to the bar, or licensed to plead, are termed but rifters, an appellation equivalent to licentiate in other countries.

BAR, or Barr, (Latin barra, and in French barre). in a legal fenfe, is a plea or peremptory exception of a defendant, sufficient to destroy the plaintiff's action. And it is divided into bar to common intendment, and bar special; bar temporary, and perpetual. Bar to a common intendment is an ordinary or general bar, which usually disableth the declaration of the plaintiff; bar special is that which is more than ordinary, and falls out upon fome special circumstance of the fact as to the case in hand. Bar temporary is such a bar as is good for the prefent, but may afterwards fail; and har perpetual is that which overthrows the action of the plaintiff for ever.

BAR, in heraldry, an ordinary in form of the fels, but much lefs. See HERALDRY.

BAR, in the manege, the highest part of that place of a horse's mouth situated between the grinders and rushes, so that the part of the mouth which lies under and at the fide of the bars retains the name of the gum. A horfe with feufible bars has a fine light mouth, with an even and firm appui. See Arrui.

To BAR a Vein, in farriery, is an operation performed upon the veins of the legs of a horfe and other parts, with intent to flop the malignant humours. It is done by opening the skin above it, disengaging it, and tying it both above and below, and striking between the two, ligatures.

BAR, in mufic, a ftroke drawn perpendicularly across the lines of a piece of music, including between each two a certain quantity or measure of time, which is various as the time of the mulic is either triple or common. In common time, between each two bars is included the measure of four crotchets; in triple, three. The principal use of bars is to regulate the beating of time in a concert. The use of bars is not to be traced. higher than the time when the English translation of Adrian le Roy's book, on the tablature was published, viz. the year 1574; and it was fome time after that before the use of bars became general. To come nearer to the point, Barnard's cathedral music, printed in 1641, is without bars; but bars are to be found throughout in the Ayres and Dialogues of Henry Lawes . published in 1653; from whence it may be conjectured that we owe to Lawes this improvement.

5 H.z.

Baran-

Bar, in hydrography, denotes a bank of fand, or other matter, whereby the mouth of a river is in a manner choked up.

The term ber is also used for a flrong beam wherewith the entrance of a harbour is fecured: this is more commonly called boom.

BAR of a tavern or concehouse, the place where the waiters attend to answer the calls of the customers.

BAR, among printers, denotes a piece of iron with a wooden handle, whereby the ferew of the prefs is turned in printing. See Printing.

Baks of Iron, are made of the metal of the fows and pigs as they come from the furnace. These pass through two forges called the finery and the chaufery; where, undergoing five feveral heats, they are formed into bat -.

Bar, a very throng city of Podolia in Poland upon the river Krow. E. Long. 28. 30. N. Lat. 50. 6.

HAR, a duchy of France, bounded on the east by Lorrain, on the north by Luxembourg, on the west by Champagne, on the fouth by part of the fame country, and by Franche Compte. It is croffed by the river Meule from north to fouth, and watered by feveral other rivers, which render it very fertile. It is divided into four baliages, viz. Baffilyni, Bar, St Michael, and Clermont. The chief towns are Bar-le-duc, Clermont, St Michael, Longuey, Pont a Mouffon, and Stenay. In 1736, it was given to Stanislaus then king of Poland.

Bax-le-duc, the capital of the duchy of Bar, feated on the declivity of a hill. It is divided into the higher and lower town: the lower is watered by the rivulet Orney, which abounds with excellent trouts. The wines are excellent, and not inferior to those of Champagne. F. Long. 5. 30. N. Lat. 48. 35.

Bur-le Mont, a town of the French Netherlands, in Hainault, fituated on the river Sambre. E. Long. 3. 40.

N. Lat. 50. 10.

٧,

Bar fur Auche, an ancient town of France, seated at the foot of a mountain. E. Long. 4. 50. N. Lat.

BAR fur Scine, a town of France, in the duchy of Burgundy, feated between a mountain which covers it on the well, and the river Seine, which runs on the east. E. Long. 4. 30. N. Lat. 48. 5.

BAK-Mafter, among miners, the person who keeps

the gauge, or doll, for measuring the ore.

BARA (anc. geog.), a small island in the Adriatic, eppolite to Brundulium: the Pharos of Mela. Alfo a finh or arm of the fea of Britannia Secunda (Ptolemy); supposed to be the Murray frith.

BURA, one of the Hebrides or Western Islands of Scotland. It is a small rock, only a quarter of a mile in circumference, being part of a chain-called the Long Island, the whole cluster appearing at low water as one island. Bara is altogether barren; but abounds with great numbers of fea fowl, fuch as folan geefe, guillamotes, puffins, &c.

BARA, the name of a festival celebrated with much magnificence at Messina, and representing the assumption of the Virgin. The lara, though used as the general denomination of this festival, significs more particularly a valt machine 50 feet high, at the top of which a young will of 14, representing the Virgin, stands upon the hand of an image of Jesus Christ.

Round him turn vertically, in a circle, 12 little chil- Darabiazhdren which represent the feraphines; below them, in another circle, which turns horizontally, are 12 more reprefenting the cherubims: below these a fun turns vertically, with a child at the extremity of each of the four principal radii of his circle, who afcerd and de- Hard's D. feend with his rotation, yet full fland upright. Beger place low the fun is the lowest circle, about seven feet from Travels the ground, in which 12 boys turn horizontally with through \$60 out interruption; these are intended for the twelve. In &c. apollles, who are supposed to surround the tomb of the Virgin at the moment when the aftends into heaven. This complication of superstitions whirliggs may have already nearly turned the flomachs of fome of our readers, or at least rendered them squeamish. think of the poor little cherubins, feraphims, and apofiles, who are twirled about in this proceffion! for, fays M. Houel " fome of them fall affeep, many of their vomit, and feveral do full worfe:" but these unseemly effusions are no drawback upon the edification of the people; and nothing is more common than to fee fathers and mothers foliciting with ardour for their boys and girls the pious distinction of puking at the hara. This machine is not drawn by after or mules, but by a multitude of robult monks.

BARABINZIANS, a tribe of Tartars, living on both fides of the river Irtis. They feem to derive their name from the Barbaian defert, whose lakes supply them abundantly with fish, on which and their cattle they chiefly fubfitt. They have plenty of game and wild fowl of every kind, particularly ducks and puffins. Most of them are Heathens, but Mahometanism daily gains ground among them. Some of them pay tribute to the empress of Russia, and others to the Khan Taisha.

BARACOA, a town in the north-east part of the island of Cuba. W. Long. 76. 10. N. Lat. 21. 5.

BARALIPTON, among logicians, a term denoting the first indirect mode of the first figure of syllogism. A fyllogism in baralipton, is when the two first propofitions are general, and the third particular, the middle term being the subject in the first proposition, and the predicate in the fecond. The following is of this kind:

BA. Every evil ought to be feared;

RA. Every violent passion is an evil;

LIP. Therefore fomething that ought to be feared is a violent paffion.

BARALLOTS, in church history, a feet of heretics at Bologna in Italy, who had all things in common, even their wives and children. Their facility in complying with all manner of debauchery made them get the name oledientes, " compliers."

BARANCA DE MALAMBO, a town of Terra Firma in America, with a bithop's fee and a good haven. It is a place of great trade, and is feated on the river Magdaline. W. Long. 75. 30. N. Lat. 11. 10.

BARANGI, officers among the Greeks of the lower empire. Cujas calls them in Latin protedores, and others give them the name of fecurigeri. It was their hulinels to keep the keys of the city gates, where the emperor refided.

BARANWAHR, a town of Lower Hungary, in a county of the same name, taken by the emperor of Germany from the Turks in 1684. It is feated be-

Barathrum, tween Buda and Belgrade, in E. Long. 10. 5. N. Lat. Baraticie. 46. 0.

BARATHRUM, in antiquity, a deep dark pit at Athens, into which condemned perfons were cast headlong. It had fharp fpikes at the top, that no man might escape out; and others at the bottom, to pierce and torment fuch as were call in. Its depth and capacrouluels made it to be applied proverbially to a covetous person: to a glutton, called Barathro by the Romans (Lucretius, Horace), and Barathrum in the fame fense (Horace); and for a common profittate

(Plautus). BARÁTIERE (Philip), a most extraordinary instance of the early and rapid exertion of a ental faculties. This furprifing genius was the fon of Francis Baraticre, minister of the French church at Schwobach near Nuremberg, where he was born Jan. 10. 1-21. The French was his mother-tongue, together with fome words of High Dutch; but by means of his father intentibly talking Latin to Lim, it became as familiar to him as the reft: fo that, without knowing the rules of grammar, he at four years of age talked French to his mother, Latin to his father, High Dutch to the maid or neighbouring children; and all this without mixing or confounding the respective languages. About the middle of his fifth year he acquired Greek in like manner; so that in 15 months he perfectly understood all the Greek books in the Old and New Testament, which he readily translated into Latin. When he was five years and eight months old, he entered upon Hebrew; and in three years time was so expert in the Hebrew text, that from a Bible without points, he could give the fcufe of the original in Latin or French; or translate extempore the Latin or French versions into Hebrew, almost word for word; and had all the Hebrew pfalms by heart. He composed at this time a dictionary of rare and difficult Hebrew words, with critical remarks and philological observations, in about 400 pages in 4to; and, about his tenth year, amused himself for twelve months with the Rabbinical writers. With these he intermixed a knowledge of the Chaldaic, Syriac, and Arabic; and acquired a tafte for divinity and ecclefiaftical antiquity, by fludying the Greek fathers, and councils of the first four ages of the church. In the midft of thefe occupations, a pair of globes coming into his possession, he could in B or to days time refolve all the problems on them; and in about three months, in Jan. 1735, devised his proleft for the discovery of the longitude, which he communicated to the Royal Society at Loudon and the Royal Academy of Sciences at Berlin. In June 1731, he was matriculated in the university of Altorf; and at the close of the year 1732, he was presented by his father at the meeting of the reformed churches of the circle of Franconta; who, aftonithed at his wonderful talents, admitted him to askid in the deliberations of the fynod; and to preferve the memory of so singular an event, it was ordered to be registered in their acts. In 1734, the margrave of Brandenburgh Anspach granted this young feholar the ufe of whatever books he wanted from the Anfpach library, together with a pention of 50 florius, which he enjoyed three years; and his father receiving a call to the French church at Stetin in Pomerania, young Barattere was, on the journey, admitted mafter of arts, with univerfal applaule, at the univerfity of Halle: at Berlin he was honoured with feveral convertations with the king of Prufit, and was received into the Royal Academy. Towards the Barb-doc close of his life he acquired a talle for medals, inferiptions, and antiquities; metaphyfical inquiries, and experimental philosophy, intervening occasionally between thefe studies. He wrote several essays and disfertations; made aftronomical remarks, and laborious calenlations; took great pains toward a history of the herefies of the anti-trinitarians, and of the 30 years war in Germony: his last publication, which appeared in 1740, was on the succession of the hishops of Rome. The final work he engaged in, and for which he had gathered large materials, was Inquiries concerning the Egyptian Antiquities. But the substance of this blaz ing meteor was now almost exhausted; he was alway. weak and fickly; and died October 5, 1740, aged 19 years 8 months and 16 days. He published 11 different pieces, and left 20 manufcripts on various fubjects, the contents of which may be feen in his life written by M. Formey professor of philosophy at Berlin.

BARATZ (Turkish), letters patent granted by the Turkish emperors to the Greek patriarch, histops, &c. for the exercise of their ecclesiastical functions. This Baratz gives the bishops full power and author rity to establish and depose the inferior clergy, and all other religious persons; to grant licenses for marriages, and iffue out divorces; to collect the revenues belonging to the churches; to receive the pious legacies bequeathed to them; in fhort, to enjoy all the privileges and advantages belonging to their high station: and all this (as it is expressed in the baratz itself) "according to the vain and idle ceremonies of the Chriflians."

BARB, or BARBE, a horse brought from Barbary. See Equus.

BARBA, in botany, a species of pubes, or down, with which the furface of iome plants is covered. The term was invented by Linnieus; and by its application in the Species Plantarum, feems to figuify a tuft or bunch of flrong hairs terminating the leaves. M. fembry miles mum barbatum furnishes an example.

The word is also often used in composition with fome other, to form the trivial names of leveral plants, as barba jovis, barba capra, &c.

BARBACAN, or BARBICAN, an outer defence of fortification to a city or caftle, used especially as a sence to the city or walls; also an aperture made in the wall of a fortress, to five through upon the enemy. See CASTLE.

BARBACAN is also used to denote a fort at the entrance of a bridge, or the outlet of a city, having a double wall with towers.

BARBADOES, the most easterly of all the Caribbee iflands, subject to Great Britain, and, according to the best geographers, lying between 59. 50. and 60. 2. of west longitude, and between 12. 56. and 13. 16. of north latitude. Its extent is not certainly known: the most general opinion is, that it is 25 miles from north to fouth, and 15 from east to west; but these mensu-Lations are subject to so many difficulties and uncertainties, that it will perhaps convey a more adequate idea of this island to tell the reader that in reality it does not contain above 107,000 acres. The climate is hot, but not unwholesome, the heat being qualified by Malca

subsdoes, fea breezes; and a temperate regimen renders this illand as fafe to live in as any climate fouth of Great Britain; and, according to the opinion of many, as even Great Britain itself. This island has on its east fide two streams that are called rivers, and in the middle is faid to have a bituminous spring which sends forth a liquor like tar, and ferves for the same uses as pitch or lamp oil. The island abounds in wells of good water, and has several reservoirs for rain water. Some parts of the foil are faid to be hollowed into caves, some of them capable of containing 300 people. These are imagined to have been the lurking places of runaway negroes, but may as probably be natural excavations. The woods that formerly grew upon the island have been all cut down, and the ground converted into fugar plantations. When those plantations were first formed, the foil was prodigiously fertile, but has fince been worn out, insomuch, that about the year 1730, the planters were obliged to raife cattle for the fake of their dung, by which means the profit of their planta- " tions was reduced to less than a tenth of its usual value. Notwithstanding the smallness of Barbadoes, its soil is different; being in some places fandy and light, in others rich, and in others fpongy; but all of it is cultivated according to its proper nature, so that the island prefents to the eye the most beautiful appearance that can be imagined. Oranges and lemons grow in Barbadoes in great plenty, and in their utmost perfection. The lemon juice here has a peculiar fragrancy. The citrons of Barbadoes afford the best drams and sweetmeats of any in the world, the Barbadoes ladies excelling in the art of preserving the rind of the citron fruit. The juice of the limes, or dwarf lemons, is the most agrecable fouring we know, and great quantities of it have of late been imported into Britain and Ireland. The pine apple is also a native of Barbadoes, and grows there to much greater perfection than it can be made to do in Europe by any artificial means. A vaft number of different trees peculiar to the climate are also found to flourish in Barbadoes in great persection; fuch as the aloe, mangrove, calabath, cedar, cotton, mallich, &c. Here likewise are produced some sensitive plants, with a good deal of garden fluff, which is common in other places. In short, a native of the finest, the richest, and most diversified country in Europe, can hardly form an idea of the variety of delicious and at the same time nutritive vegetable productions with which this island abounds.

When Barbadoes was first discovered by the English, few or no quadrupeds were found upon it, except hogs, which had been left there by the Portuguese. For convenience of carriage to the sca side, some of the planters at first procured camels; which undoubtedly would in all respects have been preferable to horses for their sugar and other works; but the nature of the climate difagreeing with that animal, it was found impossible to preserve the breed. They then applied for horses to Old and New England: from the former they had those that were fit for show and draught; from the latter those that were proper for mounting their militin, and for the faddle. They had likewife fome of an inferior breed from Curassao, and other settle-They are reported to have had their first breed of black cattle from Bonavista and the isle of Mayo; they now breed upon the island, and often

do the work of horses. Their affect are very fer-Burbadoes. viceable in carrying burdens to and from the plantations. The hogs of Barbadoes are finer eating than those of Britain, but the few sheep they have are not near fo good. They likewife have goats, which when young are excellent food. Racoons and monkeys are also found here in great abundance. A variety of birds are produced on Barbadoes, of which the humming bird is the most remarkable. Wild fowl do not often frequent this island: but sometimes teal are found near their ponds. A bird which they call the man of war. is faid to meet thips at 20 leagues from land, and their return is, to the inhabitants, a fure fign of the arrival of these ships. When the wind blows from the fouth and fouth-west, they have flocks of curlews, plovers, fnipes, wild pigeons, and wild ducks. The wild pigeons are very fat and plentiful at fuch scasons, and rather larger than those of England. The tame pigeons, pullets, ducks, and poultry of all kinds, that are bred at Barbadoes, have also a fine flavour, and are accounted more delicious than those of Europe. Their rabbits are fearce; they have no hares; and if they have deer of any kind, they are kept as curiofities. The infects of Barbadoes are not venomous, nor do either their fnakes or feorpions everling. The moschettoes are troublesome, and bite, but are more tolerable in Barbadoes than on the continent. Various other infects are found on the island, some of which are troublesome, but in no greater degree than those that are produced by every warm fummer in England. Barbadoes is well supplied with fish; and some caught in the sea surrounding it are almost peculiar to itself; such as the parrot fift. fnappers, gray cavallos, terbums, and coney fish. The mullets, lobsters, and crabs, caught here are excellent; and the green turtle is perhaps the greatest delicacy that ancient or modern luxury can boaft of. At Barbadoes this delicious shell fish feldom fells for less than a shilling a pound, and often for more. There is found in this island a kind of land crab which eats herbs wherever it can find them, and shelters itself in houses. and hollows of trees. According to report, they are a thell fish of passage; for in March they travel to the fea in great numbers. See CANCER.

The inhabitants may be reduced to three classes; viz. the masters, the white servants, and the blacks. The former are either English, Scots, or Irish: butthe great encouragement given by government to the peopling of this and other West Indian islands, induced fome Dutch, French, Portuguese, and Jews, to settle among them with their estates; by which, after a certain time, they acquire the rights of naturalization in Great Britain. The white fervants, whether by covenant or purchase, lead more easy lives than the daylabourers in England; and when they come to be overfeers, their wages and other allowances are confiderable. As to the treatment of the negro flaves in this and the other islands, that falls to be spoken of under the articles NEGRO, SLAVE, WEST INDIES; which fee. The manners of the white inhabitants, in general, are the same as in most polite towns and countries in Europe. The capital of the island is called Brulge Town; fee that article.

As the history of this island furnishes no very remarkable events, the following fhort hints concerning it may fuffice :--

Barbadocs.

When the English, some time after the year 1625, Barbara. first landed here, they found it the most savage and deflitute place they had hitherto vifited. It had not the leaft appearance of ever having been peopled even by favares. There was no kind of beafts of pasture or of prey, no fruit, no herb, no root fit for support. ing the life of man. Yet as the climate was fo good, and the foil appeared fertile, some gentlemen of small fortune in England refolved to become adventurers thither. The trees were fo large, and of a wood fo hard and flubborn, that it was with great difficulty they could clear as much ground as was necessary for their fubfillence. By unremitting perfeverance, however, they brought it to yield them a tolerable support; and they found that cotton and indigo agreed well with the foil; and that tobacco, which was beginning to come into repute in England, aufwered tolerably. These prospects, together with the storm between the king and parliament, which was beginning to break out in England, induced many new adventurers to. transport themselves into this island. And what is extremely remarkable, fo great was the increase of people in Barbadoes, 25 years after its first fettlement, that in 1650 it contained more than 50,000 whites, and a much greater number of negro and Indian flaves. The latter they acquired by means not at all to their honour: for they feized upon all those unhappy men, without any pretence, in the neighbouring islands, and carried them into flavery; a practice which has rendered the Caribbee Indians irreconcileable to us ever fince. They had begun a little before this to cultivate fugar, which foon rendered them extremely wealthy. The number of flaves, therefore, was full augmented; and in 1676 it is supposed that their number amounted to 100,000, which, together with 50,000 whites, made 150,000 on this small spot: a degree of population unknown in Holland, China, or any other part of the world most renowned for numbers. At this time Barbadoes employed 400 fail of ships, one with another, of 150 tons in their trade. Their annual exports, in fugar, indigo, ginger, cotton, and citronwater, were above 350,000l. and their circulating cash at home was 200,000l. Such was the increase of population, trade, and wealth, in the course of 50 years. But fince that time this island has been much on the decline; which is to be attributed partly to the growth of the French fugar colonies, and partly to our own establishment in the neighbouring isles. Their numbers at present are faid to be 20,000 whites and 100,000 flaves. Their commerce confilts of the fame articles as formerly, though they deal in them to less extent.

BARBADORS- Tar, a mineral fluid of the nature of the thicker fluid bitumens, of a nauseous bitterish taste, very firong and difagreeable fmell, found in many parts of America trickling down the fides of the mountains, and fometimes floating on the furface of the waters. It has been greatly recommended in coughs and other diforders of the breaft and lungs.

BARBARA, among logicians, the first mode of

the first figure of syllogisms. A syllogism in barbara Burbarh is one whereof all the propolitions are universal and affirmative: the middle term being the subject of the Barbaro fu! proposition, and attribute in the second.

Examp. BAR. Every wicked man is miserable: BA. All tyrants are wicked men; RA. Therefore all tyrants are miserable.

BARBARIAN, a name given by the ancient Greeks and Romans to all who were not of their own country, or were not initiated in their language, manners, and customs. In this fense, the word fignified with them no more than foreigner; not fignifying, as among us, a wild, rude, or uncivilized person.

BARBARISM, in a general fense, a rudeness of

language or behaviour.

BARBARISM, in grammar, an offence against the purity of flyle or language; or an ungrammatical way of speaking or writing, contrary to the true idiom of any

particular language.

BARBAROSSA (Aruch, and Hayradia), two famous corfairs, the fons of a potter in the ifle of Lefbos; who, turning pirates, carried on their depredations with fuch fuccess and conduct, that they were foon possessed of 12 galleys beside smaller vessels. Of this fleet Aruch the elder brother, called Barbaroffa from the redness of his beard, was admiral, and Hayradin the second in command; they called themselves the friends of the fea, and the enemies of all who failed upon it; and their names became terrible from the fleaits of Dardanelles to those of Gibraltar. With such a power they wanted an effablishment; and the opportunity of fettling themselves offered in 1516, by the inconfiderate application of Entemi king of Algiers to them for affiftance against the Spaniards. Aruch, leaving his brother to command the fleet, carried 5000 men to Algiers, where he was received as their deliverer; and fecretly murdering the prince he came to aid, caused himself to be proclaimed king in his stead, To this usurpation he added the conquest of Tremecen; when his exploits and piracies induced the emperor Charles V. to furnish the Marquis de Gomarez governor of Oran with troops to suppress him; by whom he was defeated and killed near Tremecon. His brother Hayradin, known also by the name of Barbaroffa, assumed the sceptre at Algiers with the same abilities, and with better fortune; for the Spaniards, fufficiently employed in Europe, giving him no difturbance, he regulated the interior police of his kingdom with great prudence, carried on his naval operations with vigour, and extended his conquests on the continent of Africa. He put his dominions under the protection of the grand figuior, Solyman the Magnificent; and obtained the command of the Turkish sleet. -With fo powerful a protector, he acquired the kingdom of Tunis in a manner similar to that by which his brother gained Algiers. Since the time of the Barbarossas, Algiers has been understood to be dependent on the Porte; but this dependence is now little more than mercly nominal.

ERRATA in ASTRONOMY, Vol. II. Part II.

The following omiffions and mistakes in the Plates the Reader will be pleased to rectify with his pendin sign 156. (Plate LXXV.) is wanting at the Sun's place, and C at the centre of the Earth.

In Plate LXXXVI. sign 205, the circle most to the lest hand wants N at the North Pole, and Æ at one extremity of the Equator. The circle next to it wants likewise N at the North Pole, and Æ at the Equator, represented there by a double arch of a circle. S is wanting at the southern extremity of the axis, and T at the extremity of the Tropic of Cancer, represented by a black single arch of a circle. In the next circle Q is wanting at the right hand extremity of the Equator, represented there by a double straight hand. And in the fourth circle to the right hand, Q ought to be substituted in the place of Q at the right hand extremity of the Equator.
